## BK 50 Z - 1 1 U W A / D.. 09L A 4 - TF - S / ES 010 A 9 HN / C2

### B K 50 Z X - 1 1 U W A

- | | | | | | | | | | A = SSV Cover
- | | | | | | | | | | W = Double Shaft Seals
- | | | | | | | | | | V H = Front and Rear
- | | | | | | | | | | V = Flange A or C or Torque Arm front
- | | | | | | | | | | H = Flange A or C or screw-on Torque Arm rear
- | | | | | | | | | | U = Foot on down or Torque Arm screwed on in upward direction
- | | | | | | | | | | O = Foot on top or Torque Arm screwed on in upward direction
- | | | | | | | | | | R = Foot right or Torque Arm screwed on in the direction to the right
- | | | | | | | | | | L = Foot left or Torque Arm screwed in direction to the left
- | | | | | | | | | | 0 = Splined Shaft acc. to DIN 5480
- | | | | | | | | | | 1 = Solid Shaft, front
- | | | | | | | | | | 2 = Solid Shaft, rear
- | | | | | | | | | | 3 = Solid Shaft, front and rear
- | | | | | | | | | | 4 = Hollow Shaft with Keyway
- | | | | | | | | | | 5 = Hollow Shaft for Shrink disk connection, rear (Standard)
- | | | | | | | | | | 6 = Hollow Shaft for Shrink disk connection, front (Special)
- | | | | | | | | | | 7 = Solid Shaft front, flush with Standard-Flange only BG10-BG90 and BS02+BS03
- | | | | | | | | | | 8 = Solid Shaft rear, flush with Standard-Flange only BS02+BS03
- | | | | | | | | | | 9 = Solid Shaft front and rear, flush with Standard-Flange only BS02+BS03
- | | | | | | | | | | 0 = Gear Housing, no surfaces except torque arm bore for BF
- | | | | | | | | | | 1 = Gear Housing, Foot
- | | | | | | | | | | 2 = Gear Housing, Standard flange diameter 1 small A-Flange
- | | | | | | | | | | 3 = Gear Housing, Standard flange diameter 2 Standard A-Flange
- | | | | | | | | | | 4 = Gear Housing, Standard flange diameter 3 large A-Flange
- | | | | | | | | | | 5 = Gear Housing, with Torque Arm for BK + BS as screw-on
- | | | | | | | | | | 6 = Gear Housing, Foot-threaded bores
- | | | | | | | | | | 7 = Gear Housing, C - Flange
- | | | | | | | | | | 8 = Gear Housing, completely machined
- | | | | | | | | | | 9 = Gear Housing, with Footplate only BG (Universal housing)
- | | | | | | | | | | - = separates gear type from gear design
- | | | | | | | | | | X = reinforced bearings (radial)
- | | | | | | | | | | Z = Gearbox with pre-stage
- | | | | | | | | | | •• = Gear Size (03, 04, 05, 06, 10, 15, 20, 30, 40, 50, 60, 70, 80, 90, 100)
- | | | | | | | | | | B • = Gear type (BG, BF, BK, BS)

### D .. 09 L A 4 - TF - S

- | | | | | | | | | | S = rectifier (see chapter 3)
- | | | | | | | | | | TF = Motor monitoring (see chapter 3)
- | | | | | | | | | | 4 = No. of pole for motor
- | | | | | | | | | | LA = Motor core length and design
- | | | | | | | | | | 09 = Motor size
- | | | | | | | | | | .. = A Aseptic motor
- | | | | | | | | | | .. = NF Motor without Gearbox, Motor in flange design
- | | | | | | | | | | .. = PE Three-Phase Motor with increased efficiency acc. to IE3
- | | | | | | | | | | D = Three-Phase Motor

### ES 010 A 9 HN

- | | | | | | | | | | HA = Hand Release (lockable)
- | | | | | | | | | | HN = Hand Release (none lockable)
- | | | | | | | | | | 9 = Code for setting torque
- | | | | | | | | | | A = Design
- | | | | | | | | | | 010 = Brake size
- | | | | | | | | | | ES = Single disk brakes - HOLDING BRAKE
- | | | | | | | | | | ZS = Double disk brakes - HOLDING BRAKE
- | | | | | | | | | | ESX = Single disk brakes - WORKING BRAKE
- | | | | | | | | | | ZSX = Double disk brakes - WORKING BRAKE

# Energy Efficient Geared Motors

## Bauer Gear Motor - profile

---

### Innovation since 1927

During its 90-year history, Bauer Gear Motor has developed to become the preferred international provider of high-quality and extremely reliable geared motors. A great deal of knowledge has been accrued over the decades, and this has continually been built upon and shared. Bauer has pioneered many new geared motor solutions and will continue to do so in the future. Our engineers develop technically-advanced solutions that feature energy-efficient motors paired with optimal gearboxes so that we can offer our customers the lowest possible operating costs. It is not without reason that the Bauer brand has become world famous; this is because our geared motor solutions are the driving power in drive technology.

### Competent and customer-focused

We see ourselves as the value adding partner for individual drive technology solutions along the entire customer value chain ... **Uncomplicated ... Competent ... Enduring.** With our global sales and expertise, we are there to support you side by side- right from the design of your drive. Our employees will ensure that you have the optimum geared motor solution for your application

Our quick response time to requests ensures that you receive the required offer within 24 hours. After your order has arrived, we check your order details and you will receive a confirmation of the order within 24 hours. This means that you will have the details for your own production planning process by the following day.

As we concentrate our production in regional factories, we are also able to deliver customised solutions from the factory reliably and directly, with an extremely short delivery period.

# Energy Efficient Geared Motors

## Bauer Gear Motor - profile

### Closer to the customer's needs thanks to greater flexibility

Orders are processed immediately and passed on to our production team. By reducing set-up times, we are able to start producing the order specific parts right away. This is synchronised with assembly, ensuring that the parts are available according to just-in-time principles.

The entire manufacturing processes starting from the production of the motor, the mechanical geared motor parts and the electrical components, are perfectly coordinated to ensure greater process reliability and availability. This means that a high delivery reliability of over 95% can be achieved, while maintaining Bauer's high quality.

### The product range

# Energy Efficient Geared Motors

## Bauer Gear Motor - profile

---

### Helical Geared Motors

- Power range from 0.03 kW to 75 kW
- 13 gear sizes for torques ranging from 20 Nm to 18500 Nm
- New attachment possibilities with low design height
- High efficiency through 2-stage base design
- High protection rating of IP65 as standard

### Shaft Mounted Geared Motors

- Power range from 0.03 kW to 75 kW
- 10 gear sizes for torques ranging from 90 Nm to 18500 Nm
- Gearbox housing with integral torque arm
- High efficiency through 2-stage base design
- High protection rating of IP65 as standard

### Bevel Geared Motors

- Power range from 0.03 kW to 75 kW
- 10 gearbox sizes for torques ranging from 80 Nm to 18500 Nm
- Right angle with universal, space-saving mounting options
- High efficiency through 2-stage base design
- High protection rating of IP65 as standard

### Worm Geared Motors

- Power range from 0.03 kW to 5.5 kW
- 8 gearbox sizes for torques ranging from 25 Nm to 1000 Nm
- Hollow shaft version available from 25 Nm
- Heavy duty worm gearing for a long service life
- High protection rating of IP65 as standard

### Monorail Geared Motor Drives

- Torque rating from 30 Nm to 680 Nm
- Radial force up to 25,000 N
- Gearboxes with a wide range of mounting options
- High protection rating of IP65 as standard
- Improved efficiency
- low energy consumption - ideal for travel drives
- Reverse motion of gearbox possible with released brake

### AsepticDRIVE

- Motor without cooling ribs and fan
- Available with helical, shaft-mounted, bevel and worm gearboxes
- Motor winding with thermistors and ISO class F as standard
- IP67 and IP69K protection ratings with alkali and acid-resistant coating as standard.
- Motor connection through standard, round stainless steel connector

### CleanDRIVE

- Motor without cooling ribs and fan
- Available with helical, shaft-mounted, bevel and worm gearboxes
- Motor winding with thermistors and ISO class F as standard
- Motor connection through a standard terminal box or stainless steel cable gland

# Energy Efficient Geared Motors

## Bauer Gear Motor - profile

### HiflexDRIVE

#### BK04 gearbox

- Torque 80 Nm
- Gear reductions 7.25 – 63.33

#### BK08 gearbox

- Torque 200 Nm
- Gear reductions 4.44 - 102.5

#### BK17 gearbox

- Torque 330 Nm
- Gear reductions 4.54 - 108.6

#### Motors

- Output power 0.12 kW ... 3.0 kW
- Efficiency classes no rating and IE1 to IE4
- Enclosure IP65 (standard)  
IP67 / IP69K (optional)

### Energy-efficient motor solutions

#### Mains Supply

- IE1 asynchronous technology 0.12 kW – 45 kW
- IE2 asynchronous technology 0.12 kW – 45 kW
- IE3 asynchronous technology 0.12 kW – 45 kW
- IE4 asynchronous technology 0.55 kW – 4 kW

#### Inverter Duty

- IE3 PMSM-technology 1.5 kW – 15 kW
- IE4 PMSM-technology 0.55 kW – 11 kW

### Energy-efficient motor solutions for explosion hazard areas

The S series in permanent magnet synchronous motors (PMSMs) offers variable-speed geared motors in efficiency class IE4 for use in explosion hazard areas<sup>[1]</sup>.

- Design torque  $M_N$ : 5 Nm – 48 Nm
- Rated power  $P_N$ : 0.75 kW – 15 kW
- Increased safety for zone 1 II 2 G Ex e IIC T1 - T3 Gb
- Dust explosion protection – Zone 21 II 2 D Ex tb IIIC T 160°C ... 120° Db

<sup>[1]</sup> Individual motor designs can show lower efficiency classes than IE4 at rated torque.

### EtaK2.0 Decentral Solutions

- PMSM enabled
- Integrated safety technology and field bus communication according to specific needs
- Modular structure minimises spare parts stock
- Energy savings of up to 30 % possible under partial load conditions
- Suited to extremely harsh environments thanks to IP65 enclosure rating
- 200 % overload current (3 s)
- Sensorless vector control
- CANopen, Profibus, Profinet, EtherCAT, EtherNet/IP and AS-Interface
- STO safety function

# Energy Efficient Geared Motors

## Bauer Gear Motor - profile

---

### Submersible Solutions

- **Special sealing concepts** for maximum leakage protection
- **Reinforced bearings** for higher strength and longer service life
- **Shafts** available on request in V4A steel or coating
- **Motor Connection**
  - Standard with cast terminal box
  - Optional with special plug connection
- **Additional features:**
  - Special design for continuous submersible operation
  - Electronic leakage detection available on request
  - Brakes available in IP68 design
  - Water depths of 5m (deeper on request)
- **Corrosion category Im2** based on DIN ISO 12944-5

### Customised geared motor solutions for all applications

- Special applications
- Special adaptations
- Special environments
- Series production

Based on our modular, geared motor programme, we offer specific solutions for applications in all key markets such as, for example, food & beverage, energy, wastewater, concrete, metals and material handling in applications such as washdown conveyor systems, rolling mills, monorail systems and overhead conveyors, sludge thickeners, cranes, fans and blowers and turbines. Our aim is to provide our customers with products tailored to their needs. At the same time, we take care to ensure that a geared motor solution will prove to be especially profitable throughout its entire life cycle.

We already equip our geared motors with highly efficient permanent magnet motors to achieve low life cycle costs because low energy consumption will be particularly important in the future. We are very confident that we are once again pioneers in this sector

**Bauer Gearmotors**

- Low operating costs due to a high total efficiency
- 2-stage gearbox concept gives a longer lifetime due to a reduced number of moving parts
- Lower servicing costs due to a modular system
- No additional protective measures (e.g. dusty environment) through the IP65 enclosure as standard
- The electrical design of the motor is aligned to the gearbox
- Quick reaction time in emergency situations (Breakdowns etc.) through Fast Assembly Delivery (within 24 hours)

**Bauer Gearboxes**

- Easy access to the fixation points reduces assembly times and installation costs
- Low servicing costs as the lubrication change results in normal duty with a lubrication temperature of approx. 80 °C first after 15 000 operating hours when using CLP 220 or 25 000 operating hours when using PGLP 220 / PGLP 460.
- 2-stage gearbox concept reduces the spare part stocking
- A variety of attachment possibilities (Foot, Flange, Solid and Hollow shafts, Torque arms)
- Sealed housing design reduces the risk of oil leakage and increases the oil lifetime
- The large housing volume allows usage in very harsh environments

**Bauer Motors**

- Low operating costs due to high motor efficiencies (IE1, IE2, IE3 and IE4 as Standard)
- All efficiency classes in the same motor frame size. No motor size change.
- Low installation costs through CAGE CLAMP® instead of the classical terminal block connection
- A variety of additional designs (connectors, brakes, backstops, rain covers, forced cooling, encoders etc.)
- Cost reduction of connection cabling and avoidance of additional protective elements (chokes, filters etc.), through built-on inverters (ETA-K2.0)
- Ideal for frequency inverter duty through insulation class F as standard

**Bauer Brakes**

- Low servicing costs through long lifetime of the brake discs (without adjustment)
- Brake-Motor correlation tailor made to the application by virtue of on average three brake sizes per motor size
- A variety of designs (lockable and non-lockable hand release, microswitch, heaters)
- Robust design for heavy duty applications
- Enclosure IP65 as Standard
- Very high wear resistance

# Product Description

## Selection of geared motors

2

- Installed positions of geared motors** Bauer geared motors can be supplied for any type of fitting position. Vertical installation positions (motor-down) place a particularly severe strain on the shaft seal. It is advisable to avoid this arrangement especially at high motor speeds (e.g. above 1800 r/min) and continuous operation.
- Notes on safety** See the notes on safety regarding installation in Operating Instructions.
- Guards for rotating parts** The shrink disk (SSV) guards required under the German law relating to technical materials (Law Concerning Industrial Equipment - Equipment safety law GPSG) or by the Accident Prevention Regulations (UVV) are not included in the standard scope of supply because they are fitted by the customer in most cases, or the risk of accident can be eliminated by suitable installation.  
  
See the Operating Instruction.
- Touch protection** The fan hoods, via the externally mounted fan wheels, of the entire B2000 motor series fulfil the protection against contact with the standard finger (Ø12 mm).
- Operating noise** The typical operating noise levels of BAUER geared motors are within the limits stipulated by VDI directive 2159 for gears and EN 60034-9, Table 2 for motors.  
  
For physical reasons, low-ratio, high-speed gears produce more noise than medium- and high-ratio gears operating at low speeds.
- Painting and corrosion protection** BAUER geared motors are spray-painted in RAL 7031 to DIN 1843 as standard. Other RAL colours are available at extra cost.  
  
The output shafts are shipped in protective sleeves or with a protective coating to prevent corrosion.  
The prerequisite for achieving a long protection period is the right choice of coating. The coating system from Bauer Gear Motor GmbH, based on DIN EN 12944-5, offers suitable and long-lasting corrosion protection for all areas of application.

Category	Loads	Examples of indoor areas	Examples of outdoor areas	Possible IP-Protection class
Standard	Insignificant	Insulated and heated buildings with neutral atmosphere	—	IP54 IP65
C1	Insignificant	Insulated and heated buildings with neutral atmosphere	—	IP54 IP65
C2	Low	Uninsulated and unheated buildings where condensation can occur, e.g. warehouses, sports halls	Atmosphere with low corrosive load, mostly rural areas	IP54 IP65
C3	Moderate	Production rooms with high relative humidity and some air pollution, e.g. facilities for food production, laundries, breweries, dairies	Urban and industrial atmosphere, moderate pollution by sulphur dioxide. Moderate coastal area with low salt pollution	IP65 IP66
C4	Strong	chemical plants, swimming pools, objects above sea water	Industrial and coastal areas with moderate salt exposure	IP65 IP66
C5-I	Very strong (industry)	areas with almost constant condensation and heavy contamination	Industrial areas with high relative humidity and aggressive atmosphere	IP66
C5-M	Very strong (sea)	areas with almost constant condensation and heavy contamination	Coastal and offshore areas with high salt pollution, buildings with almost constant condensation and heavy air pollution	IP66
IM2	Sea or brackish water	IP68 Underwater Drives	Port areas, lock gates, moles, offshore installations	IP68
Aseptic (proprietary development of Bauer)	Very strong	For indoor and outdoor use with very high environmental pollution and in hygiene-sensitive areas, in each case with high-pressure cleaning with chemical cleaning agents		IP67/IP69K

Duration of protection according to DIN EN ISO 12944-5: medium (M) 5 to 15 years

### Bauer bevel-geared motor with brake and standard add-ons

Example: Bauer bevel-geared motor with brake and standard add-ons

#### Significance of type designation

The type designation of a BAUER geared motor is a code designating all the features in the drive configuration.

The build-up of the type designation is explained with the help of the following example of a bevel geared motor with brake and series options.

# Type Designations

## BG-series helical-geared motor

## Versions and options

3

### BG and BF series

- V = Front  
The side of the gear unit facing away from the motor or the source of motive power
- H = Rear  
The side of the gear unit facing toward the motor or the source of motive power
- L = Left  
The left side of the gear unit as viewed from the output shaft side of type B3 for the BG series or type H4 for the BF series
- R = Right  
The right side of the gear unit as viewed from the output shaft side of type B3 for the BG series or type H4 for the BF series

### BK and BS series

BK series: type H1

BS series: type H1

- V = Front  
The side of the gear unit facing toward the viewer looking toward the type H1 unit
- H = Rear  
The side of the gear unit facing away from the viewer looking toward the type H1 unit
- L = Left  
The left side of the gear unit as viewed from the output shaft side of type H1, or the torque brace oriented to the left
- O = Top  
The top side of the gear unit as viewed from the output shaft side of type H1, or the torque brace oriented upwards
- U = Bottom  
The bottom side of the gear unit as viewed from the output shaft side of type H1, or the torque brace oriented downwards

# Type Designations

## General construction

3

### Three-phase motor

- D = Three-phase motor
- E = Single-phase motor (Steinmetz circuit)
- S = PM-Synchronous motor
- . A = Aseptic motor (germ-free drive)
- . SE = Three-phase motor with enhanced efficiency compliant with IE1
- . HE = Three-phase motor with enhanced efficiency compliant with IE2
- . PE = Three-phase motor with enhanced efficiency compliant with IE3
- . N = Motor without gear unit; foot-mount version
- . NF = Motor without gear unit; flange-mount version
- . R = Roller table motor
- . XE = Explosion-proof motor with increased safety
- . XD = Explosion-proof motors
- . W = Torque motor
- . L = Special rotor for traction and slewing gear motors
- . C = With main and auxiliary windings; only with single-phase motors (EC....)
- . V = Multiple voltage ranges (wide voltage range)
- . U = Unventilated (no forced ventilation)

### Motor protection

- TB = Thermistor 140°
- TF = Thermistor 160°
- TH = Thermistor 180°
- TEB = Thermistor warning/shutdown 120°/140°
- TBF = Thermistor warning/shutdown 140°/160°
- TFH = Thermistor warning/shutdown 160°/180°
- TOB = Thermostatic switch, NC 140°
- TOF = Thermostatic switch, NC 160°
- TOH = Thermostatic switch, NC 180°
- TSB = Thermostatic switch, NO 125°
- TSF = Thermostatic switch, NO 160°
- TSH = Thermostatic switch, NO 180°
- TX = Other

### Brake rectifier in motor terminal box

- S = Standard rectifier SG
- E = Special rectifier ESG
- M = Special rectifier MSG
- ST = Harting (other)

- Plug connector**
- Heavy-duty fan**
- Protective cover**
- CleanDrive**

- SL
- D
- CD = Aseptic drive with cable

# Type Designations

## Supplement types

3

### Brake

E	= Single-disc brake
ES	= Single-disc holding brake
EH	= Single-disc holding brake in heavy duty
ZS	= Two-disc holding brake
ESX	= Single-disc service brake
EHX	= Single-disc service brake in heavy duty version
ZSX	= Two-disc service brake
... 010	= Brake size
... .. A	= Construction state
... .. 9	= Code for configured braking torque
... .. . HN	= Manual release (not lockable)
... .. . HA	= Manual release (lockable)

### Reverse rotation block

RR	= Blocking direction clockwise
RL	= Blocking direction anticlockwise

### Digital and analogue encoder

G

### Second shaft end

ZW	= With key
ZV	= With square shaft

### Forced ventilation

FV

### Overall design

AV	= USA/Canada version with shaft dimensions in inches
AM	= USA/Canada version with metric shaft dimensions
UL	= US version
CS	= Canadian version
C1	= Coro1 corrosion protection
C2	= Coro2 corrosion protection
C3	= Coro3 corrosion protection
C4	= Coro4 corrosion protection
C5I	= Coro5 corrosion protection
C5M	= Coro5 corrosion protection
IM2	= Protection against sea or brackish water
SP	= Non-catalogue version

### Drive configuration General

Motions are necessary in production plants and equipment for the manufacture of goods and products. Geared motors are used to implement these motions in stationary production equipment. The objective of drive configuration is to obtain the optimal motor for each type of motion.

Motions in machines and equipment vary considerably. Experienced design engineers reduce the necessary motions to a few standard types:

- continuous linear motion
- reciprocating linear motion
- horizontal linear motion
- vertical or oblique linear motion for lifting and lowering loads
- continuous rotary motion and reciprocating rotary motion

All motions can be divided into:

- an acceleration phase
- a constant-velocity phase
- a braking (deceleration) phase

These motion phases must be examined separately when sizing a drive, in order to determine the phase with the highest load. After the maximum load has been determined, the drive system can be selected.

See our separate “Design Guide” publication for assistance with various use cases.

### Required data for drive configuration

In addition to the data on (Specification of geared motors), the following data is necessary for drive configuration:

Designation	Description	Unit
Z	Cycle rate	[1/h]
$t_d$	Operating time per day	[h]
$t_a$	Deceleration time	[s]
$n_2$	Output speed	[rpm]
n	Rated rotor shaft speed	[rpm]
J	Moment of inertia	[kgm <sup>2</sup> ]
$J_{ext}$	External moment of inertia	[kgm <sup>2</sup> ]
$J_{ext}$	External moment of inertia referred to the rotor shaft	[kgm <sup>2</sup> ]
$J_{rot}$	Rotor moment of inertia	[kgm <sup>2</sup> ]
F	Force	[N]
m	Mass	[kg]
v	Velocity	[m/s]
a	Acceleration	[m/s <sup>2</sup> ]
g	Earth gravitational constant	[m/s <sup>2</sup> ]
$P_{dyn}$	Dynamic power	[kW]
$P_s$	Static power	[kW]
P	Power	[kW]
$M_2$	Output torque	[Nm]
$M_{2erf}$	Required drive torque	[Nm]
$M_N$	Rated torque at rotor shaft	[Nm]
$M_a$	Deceleration torque	[Nm]
$M_L$	Braking or driving load torque	[Nm]
$M_{gr}$	Specific limiting torque of gearbox at gear ratio i	[Nm]
$M_{Br}$	Rated braking torque	[Nm]
i	Gear reduction ratio	
FI	Inertia ratio	

### Drive configuration process

#### Motor configuration

#### Determining the motor power

The required power can generally be calculated as follows:

$$p = \frac{F \times v}{\eta}$$

As previously described, all motions are divided into an acceleration phase (dynamic power), a constant-velocity phase (static power), and a braking (deceleration) phase.

Depending on the type of motion, the force  $F$  necessary to overcome all opposing forces such as rolling friction, linear friction, gravitational force, acceleration and so on arising from the drive train has a strong influence on the required power and must be determined explicitly for each use case.

See Section 15 for assistance in selecting the right motor power.

#### Determining the required torque

After the motor power has been determined, the required gearbox output torque can be calculated with:

$$M_2 = \frac{P \times 9550}{n_2}$$

#### Determining the gear reduction ratio

The gear reduction ratio is the ratio of the rated speed of the motor (see the motor data in Section 15) to the desired output speed of the geared motor.

$$i = \frac{n}{n_2}$$

#### Gearbox size selection

#### Determining the factor of inertia

The inertia ratio is the ratio of the sum of the moments of inertia of all masses driven by the motor and converted to the motor speed, including the moment of inertia of the motor rotor, to the moment of inertia of the rotor:

$$FI = \frac{J_{\text{ext}} + J_{\text{rot}}}{J_{\text{rot}}} \quad \text{where} \quad J_{\text{ext}} = \frac{J_{\text{ext}}}{i^2}$$

# Gear Motor Selection

## Drive configuration

### Determining the shock load

The shock load (see Sections 6, 7, 8 and 9) is determined from the inertia factor, the type of transmission component and the relative moment of acceleration.

### Determining the minimum service factor $f_{Bmin}$

Based on the operating time per day, the cycle rate and the ascertained shock load, the service factor  $f_{Bmin}$  can be taken from the tables in Sections 6, 7, 8 and 9.

Based on this minimum service factor  $f_{Bmin}$ , select a geared motor from the tables that has a higher service factor as well as the required output speed, output torque and motor power.

Note: The service factor relates solely to the required torque for static operation needed by the application, which should be covered by the output torque of the selected geared motor.

The dynamic portion is not taken into consideration here.

The actual service factor of the geared motor with regard to required torque for static operation can therefore be calculated as follows:

$$f_B = \frac{M_{gr}}{M_{2erf}}$$

The final step is to specify the accessory options for the geared motor.

### Brake specification

Essentially it is necessary to determine, based on the amount of friction energy to be dissipated by the brake, whether the brake is a holding brake or a service brake. See Section 16 for the definitions of holding brakes and service brakes.

Once all the necessary data and requirements are known, the required braking torque can be calculated as follows:

$$M_{br} = M_a \pm M_L$$
$$M_a = \frac{J \times n}{9,55 \times t_a}$$

If the specific application data is not known, for horizontally driven equipment we recommend selecting a braking torque that is 1.0 to 1.5 times the rated torque of the motor.

In the case of applications with significant external moments of inertia (FI greater than 2) and with operating cycles per hour, the brake size must always be selected on the basis of the thermally allowable braking energy. See Section 16 for detailed information on brake configuration.

In the case of lifting equipment, for safety reasons a braking torque twice as large as the rated torque of the motor should always be selected.

### Torque–speed characteristic

The torque versus speed curve shows the operating characteristics of the asynchronous motor. The reference points shown schematically on the torque versus speed curve are significant criteria for motor selection.

#### Torque vs. Speed Curve

The **starting torque  $M_A$**  with the rotor stationary, which is also called the locked-rotor torque, determines the acceleration of the equipment or system. If the motor is powered directly from the mains, bear in mind that the starting torque, usually listed in the motor data tables in the form of the ratio  $M_A/M_N$ , is a fixed and unalterable quantity. This means that the desired acceleration can only be approximated when the motor is operated directly from the mains. Operation from a frequency converter is discussed separately.

The **pull-up torque  $M_S$**  is the least amount of torque developed by the motor while it is coming up to speed. It must always be greater than the effective load torque at the time when the pull-up torque occurs, as otherwise it will not be possible to accelerate the drive.

The **breakdown torque  $M_K$**  is the maximum torque the motor is capable of producing. If the load increases above the rated torque  $M_n$ , the slip  $s$  increases, the speed  $n$  decreases, and the motor delivers more torque. This can rise to a maximum level  $M_k$ . After this point the motor stalls, which means that it suddenly stops running at this slip value (breakdown slip). If the breakdown torque is exceeded, either the load must be removed or the motor must be switched off immediately. Otherwise the motor will be destroyed as a result of overheating.

The **rated torque  $M_N$**  is the torque available in continuous operation at the rated power  $P_N$  and rated speed  $n_N$ .

# Gear Motor Selection

## Motor configuration

### Dynamic power

The dynamic power is the power that accelerates the entire system, which consists of the load, transmission components, gearbox and motor.

$$P_{\text{dyn}} = \frac{m \times a \times v}{\eta}$$

$P_{\text{dyn}}$	Dynamic power [W]
$m$	Mass [kg]
$a$	Acceleration [m/s <sup>2</sup> ]
$v$	Velocity [m/s]
$\eta$	Efficiency

## 4

### Static power

The static power includes all forces present under zero-acceleration conditions. This includes rolling friction, linear friction, lifting force (with lifting) and wind force, among others.

$$P_s = \frac{F_f \times v}{\eta}$$

$P_s$	Static power [W]
$F_f$	Travel resistance [N]

### Total power $P_G$

$$P_G = P_{\text{dyn}} + P_s$$

$$P_G = \frac{m \times a \times v}{\eta} + \frac{F_f \times v}{\eta}$$

Horizontal motion, rotary motion and vertical motion upwards	
Start-up time [s]	$t_A = \frac{\left[ J_M + \frac{J_{\text{ext}}}{\eta} \right] \times n_M}{9,55 \times \left[ M_A - \frac{M_L}{\eta} \right]}$
Cycle rate [c/h]	$Z = Z_0 \times \frac{1 - \left[ \frac{M_L}{M_A \times \eta} \right]}{\left[ \frac{J_s + \frac{J_{\text{ext}}}{\eta} + J_M}{J_M} \right]} \times K_L$
Vertical motion downwards	
Start-up time [s]	$t_A = \frac{\left[ J_M + \frac{J_{\text{ext}}}{\eta} \right] \times n_M}{9,55 \times \left[ M_A - (M_L \times \eta) \right]}$
Cycle rate [c/h]	$Z = Z_0 \times \frac{1 - \left[ \frac{M_L \times \eta}{M_A} \right]}{\left[ \frac{J_s + J_M + (J_{\text{ext}} \times \eta)}{J_M} \right]} \times K_L$

### Motor selection

Example:

Required dynamic torque at motor (for acceleration):	126 Nm
Required static torque at motor	70.0 Nm
Total torque at motor:	196 Nm

Due to the significantly higher starting torque (M<sub>A</sub>) of IE2 motors (M<sub>A</sub>/M<sub>N</sub> 3.5) compared to IE1 motors (M<sub>A</sub>/M<sub>N</sub> 2.5), an 11 kW with an IE2 (DHE16LB4) motor can be used in this case. Otherwise the 15 kW IE1 (DSE16LB) should be selected.

# Gear Motor Selection

## Motor configuration

### No-load cycle rate $Z_0$

If the cycle rate is greater than normal (typically around 60 cycles per hour), the additional thermal load and, depending on the type of power transmission, the additional mechanical load must be taken into account in motor selection.

The no-load cycle rate  $Z_0$  is the number of start cycles per hour with the motor running under no load (no external moments of inertia) in which the allowable winding temperature for the insulating material class F is reached.

No-load cycle rate  $Z_0$ :

PN [kW]	Type	Z0 [c/h]
0.12	DPE05LA4	65000
0.12	DPE06LA4	65000
0.18	DPE07LA4	47000
0.25	DPE08MA4	36000
0.37	DPE08LA4	27000
0.55	DPE08XA4	19000
0.75	DPE09LA4	15000
1.1	DPE09XA4	11000
1.5	DPE09XA4C	8700
2.2	DPE11MA4	6400
3	DPE11LA4	5000
4	DPE11LA4C	4000
5.5	DPE13LA4	3100
7.5	DPE13XA4	2400
9.5	DPE16LB4	2000
11	DPE16LB4	1800
15	DPE16XB4	1400
18.5	DPE18LB4	1200
22	DPE18XB4	1000

As a result of external loads, the no-load cycle rate is reduced to the allowable service cycle rate. The effect of the load is expressed by the inertia ratio  $FI$  and the load factor  $K_L$ .

### Load factor $K_L$

The load factor reflects the relative load  $P/PN$  and the duty cycle of the motor in operation between the cycles.

The relative load has a quadratic effect on the allowable cycle rate. The effect of the duty cycle depends on the circumstances. With little or no load, the stress on the motor decreases due to the relatively long cooling periods, while at rated load or heavy loading the stress on the motor increases due to load losses.

The load factor  $K_L$  for 4-pole motors is determined as follows:

$$K_{L100} = 1 - \left( \frac{P}{P_n} \right)^{1,5}$$

$$K_L = 0,35 + (K_{L100} - 0,25) \times ED$$

### Radial and axial forces on the output shaft

For each geared motor with a solid shaft, the allowable radial force  $F_{R(N,V)}$  referred to the centre of the output shaft,  $x = l/2$ , is listed in the selection tables. The listed data applies to both foot-mounted and flange-mounted versions. If the force application point  $F_x$  is off centre, the allowable radial force must be recalculated taking into account the bearing lifetime and the shaft strength.

### Maximum allowable radial force at force application point X

4

- $F_{R(N,V)}$  Allowable radial force ( $x = l/2$ ) according to the selection tables [N]
- $X$  Distance from shaft junction to the force application point [mm]
- $F_A$  Axial force [N]

To evaluate the radial force present at the force application point X, the allowable radial forces at position X must be determined with respect to the load limits of the bearings and the shaft strength.

If the calculated allowable radial forces at the force application point X are greater than the radial force that is present, the gearbox may be selected for the application.

If the calculated values are not sufficient or the force application point X is not within the stub shaft length l, please consult us.

### Bearing load limit

$$F_{XL1} = F_q \times \frac{0,5 + b}{\left[ \frac{X}{l} + b \right]}$$

$$F_{XL2} = F_q \times \frac{0,5 + a}{\left[ \frac{X}{l} + a \right]}$$

# Gear Motor Selection

## Radial and axial forces on the output shaft

### Shaft strength

$$F_{xw1} = F_{qmax} \times \frac{0,5}{\left(\frac{X}{l}\right)}$$

$$F_{xw2} = F_{qmax} \times \frac{0,5 + c}{\left(\frac{X}{l} + c\right)}$$

For the selected gear ratio and bearing type (normal or reinforced),  $F_q$  is the allowable perpendicular force  $F_{RN}$  or  $F_{RV}$  from the geared motor selection tables.

$F_{qmax}$  is the maximum allowable perpendicular force for the selected gearbox size as listed in the geared motor selection tables, independent of the bearing type (normal or reinforced).

The factors a, b and c for the individual gearbox types are listed in the following tables.

### Transmission components

If a transmission component is used (gearwheels, chainwheels, V-belt, etc.), the resulting radial forces can be determined as follows.

$$F_R = \frac{2000 \times M}{D_T} \times f_z \leq F_{R(N,V)}$$

$F_R$	Radial force [N]
$M$	Torque [Nm]
$D_T$	Pitch radius of the transmission component [mm]
$f_z$	Safety factor

A safety factor  $f_z$  depending on the type of transmission component attached to the output shaft must be included when determining the value of the radial force  $F_R$  that is present.

4

### Factor $f_z$ for the type of transmission component

Transmission component	Safety factor $f_z$	Note
Gearwheel	1	= > 17 teeth
Gearwheel	1,15	< 17 teeth
Chainwheel	1	= > 17 teeth
Chainwheel	1,25	< 17 teeth
Toothed rack	1,15	< 17 teeth (pinion)
V-belt	2.....2,5	From tensioning force
Flat belt	2...3	From tensioning force
Friction wheel	3...4	

### Axial force

The following specification applies to the allowable axial force  $F_A$  on the output shaft (either tension or compression) for all Bauer geared motors and for foot, flange or hollow-shaft versions:

$$F_A = 0,5 \times F_{R(N,V)}$$

Please consult us in case of larger axial forces.

# Gear Motor Selection

## Sizing based on efficiency

4

### Drive configuration based on efficiency

With the IEC 60034-30-1 standard and the ErP 2009/125/EC EU directive, utilisation of the potential energy savings in industrial environments has been given increased urgency and made legally mandatory.

In the industrial applications area, electric motors consume the vast majority of electrical energy (approximately 70 %). They are used in all areas and in many applications, such as fans, pumps, grinders, rolling mills, lifts, transport and conveying equipment, household appliances, and office machines.

Due to this broad range of applications, electrical drive systems are a primary target for energy saving policies. As electric motors consume a large amount of electrical energy, even small improvements in efficiency lead to significant savings.

In many cases, especially in transport and conveying equipment, it is necessary to reduce the speed of a three-phase squirrel-cage motor. This can be done by using external traction gearboxes or by using external or integrated reduction gearboxes. With regard to energy savings, the efficiency of the gear unit and transmission components must not be ignored.

The overall efficiency of a system is calculated as follows:

$$\eta_{\text{Installation}} = \eta_{\text{Motor}} \times \eta_{\text{Reducer}} \times \eta_{\text{Machine}}$$

### Savings potential Motor: $\eta_{\text{motor}}$

In accordance with the Motor Regulation 16640/2009/EC, the legally binding EU ErP directive 2009/125/EC specifies IE3 (Premium Efficiency) as the minimum efficiency for new motors operating in continuous running duty (S1)  $\geq 0,75$  kW, effective 1. January 2017.

The right motor frame size and motor type should be selected based on environmental and economical aspects based on the new motor regulations for the IE3 series.

The new Regulation (EU) 2019/1781 extends the scope of the affected motors in the performance and product spectrum and sets new binding implementation dates of 1 July 2021 and 1 July 2023.

### Calculation of the efficiency under partial load

The motor data sheets list motor efficiency figures according to Motor Regulation (EU) 2019/1781 for operation at several load levels (50 %, 75 % and 100 %).

The efficiency at any partial load point can be calculated approximately from the efficiency figures for 75 % and 100 % load, and the energy balance of the application can be evaluated accordingly.

$$R_{VL} = \frac{\left[ \frac{100}{\eta_{100}} - 1 \right] - 0,75 \times \left[ \frac{100}{\eta_{75}} - 1 \right]}{0,4375}$$

$$R_{VO} = \left[ \frac{100}{\eta_{100}} - 1 \right] - R_{VL}$$

$$\eta_p = \frac{100}{\left[ 1 + \frac{R_{VO}}{p} \right] + R_{VL} \times p}$$

with

$\eta_{100}$	Efficiency at 100 % load
$\eta_{75}$	Efficiency at 75 % load
$R_{VL}$ , $R_{VO}$	Intermediate results
$p$	Partial load (value range: 0 to 1 or overload)
$\eta_p$	Efficiency at partial load point $p$

### Gear efficiency $\eta_{\text{gear}}$

Comparison of the general savings potential of gearboxes and motors in continuous running duty (S1) shows that the energy savings potential of gearboxes is significantly higher than that of motors. The efficiency of gearboxes is predominantly dependent on the tooth geometry and the friction values of the bearings and seals. At high input speeds and with vertical designs in which the first stage rotates fully immersed in oil, splash losses cannot be neglected. Vertical designs should generally be avoided.

The efficiency of worm gear drives is highly speed dependent (see illustration). Bauer worm gear units are available as two-stage worm gear units for frame sizes BS04 and larger. This enables very high reduction ratios and significantly higher efficiency than with pure worm gear units. A loss of 2 % per stage can be assumed for two-stage worm gear units.

Comparison of typical efficiency ( $\eta$ ) versus reduction ratio ( $i$ ) for helical spur gear units (H) with two, three or four stages and two-stage worm gear units (S), relative to the rated power of the gear unit.

### System efficiency $\eta_{\text{system}}$

The drive system provides the highest savings potential in the analysis of the overall efficiency. Designers and plant engineers should always strive to optimise the transmission components.

Transmission component	Conditions	Efficiency
Wire rope	Per full turn on the wire drum (with journal or roller bearings)	0.91–0.95
V-belt	Per full turn on the belt pulley (with normal belt tension)	0.88–0.93
Synthetic belts	For each full turn or roll, with roller bearings (normal belt tension)	0.81–0.85
Rubber belts	For each full turn or roll, with roller bearings (normal belt tension)	0.81–0.85
Toothed belts	For each full turn or roll, with roller bearings (normal belt tension)	0.90–0.96
Chains	For each full turn or chainwheel, with roller bearings (depending on chain size)	0.90–0.96
Spindles	Trapezoid-thread spindle Ballscrew spindle	0.30 – 0.70 0.70 – 0.95
Gear unit	With spur gears or bevel gears: 2 % per stage, with worm gears and other types of tothing, according to manufacturer's data	0.94–0.98

# Gear Motor Selection

## Shock loads of machinery

Shock loads for various types of machinery are listed in standards and guidelines as well as industry-specific documents and manufacturer's documents. If for example a crusher or a press is listed here with an shock load class of III, this is justified. On the other hand, under favourable conditions a belt conveyor could have an shock load class of I, but this could quickly change to III with on/off operation, high speed and overdrive due to a loose chain.

Consequently, the classifications in the following table should by no means be taken blindly. They provide a rough point of reference, but the ultimate classification of the shock load should always take into account the factors specified by Bauer, in particular the inertia ratio, the cycle rate and the transmission component(s).

Drive	Shock load		
<b>Construction machinery</b>

## Standard mounting positions

**BG series**

Gear side	(U)	(R)	(L)	(U)	(V)	(H)
Mounting position	H4	H1	H2	H3	V1	V2

**BF series**

Gear side	(U)	(R)	(L)	(U)	(V)	(H)
Mounting position	H4	H1	H2	H3	V1	V2

# Gearboxes & Lubrication

## Standard mounting positions

5

### Position of the terminal box and the cable entry points (BG and BF)

The standard position of the terminal box for helical-gear and shaft-mounted geared motors is position I. Cables may be introduced from side A or C.

Turning or rotating the gearbox in space in the different mounting positions according to DIN 42950 does not influence the marking as shown. The details of the terminal box always show the position of the terminal box and the cable entry in relation to the gearbox and not in space. The mounting according to DIN 42950 is to be given separately.

# Gearboxes & Lubrication

## Position of the terminal box

### Position of the terminal box and the cable entry points (BK and BS)

The standard position of the terminal box for bevel-gear and worm-gear motors is position II.

Cable entry through side A or side C is possible

Turning or rotating the gearbox in space in the different mounting positions according to DIN 42950 does not influence the marking as shown. The details of the terminal box always show the position of the terminal box and the cable entry in relation to the gearbox and not in space. The mounting according to DIN 42950 is to be given separately.

### Radial and axial forces at the output shaft

The output shafts and output-shaft bearings are matched to the motor torques. It is advisable to locate the drive-transmission element's point of application as close as possible to the shaft collar to ensure that the load imposed by external radial forces is not unnecessarily high. Permissible values for radial forces referred to the output shaft centreline are listed in the selection tables. Please consult us if your application involves extra-high axial loading.

### Dimensions and fits of output shafts and keyways

Output shaft and second shaft stub, keyway and key are in compliance with the DIN standards and ISO fits listed below:

#### Solid shaft

Shaft diameter	to D = 50 mm in ISO k6 (DIN 748 Page1) as of D = 50 mm in ISO m6 (DIN 748 Page 1)
Keyway	ISO P9 (DIN 6885 Page 1)
Key, height	ISO h9 (DIN 6885 Page 1 and DIN 6880)
Bore - customer	ISO H7

#### Hollow shaft with keyway

Bore diameter	ISO H7 (DIN 748)
Keyway	ISO JS9 (DIN 6885 Page 1)
Key, height	ISO h9 (DIN 6885 Page 1 and DIN 6880)
Customer shaft	ISO h6

#### Hollow shaft for shrink-on disc coupling (SSV)

Outside diameter	ISO f7
Inside diameter	ISO H7
Customer shaft	ISO h6

### Installing transmission elements

#### Note:

Gearboxes using torque reaction by means of a flange (Code 2.; 3; 4.; 7.; 8.) or torque arm (Code 5.), must have the side for the torque reaction the same as where the radial force on the output shaft occurs (see rubber buffers for torque arms)! Please consult the factory for other designs.

### Gear with solid shaft

Always exercise meticulous care when fitting transmission elements onto output shafts and, whenever possible, use the DIN 332 tapped bore provided for this purpose. Fitting is usually easier if the transmission element can be heated to approximately 100° C for installation. Dimension the locating bore to ISO H7.

Gears with solid shaft at each end (gear code -.3/): alignment of the two keys is subject to the DIN 7168 tolerances, the degree of accuracy is "fine".

### Gear with hollow shaft

Hollow shafts usually engage solid shafts of the driven machinery. The gear unit must be mounted such as to be free of constraint and be fixed axially (e.g. by means of assembly help acc. following description "notes for installing shaft mount gears with hollow shaft and keyway"). Special contract provision must be made if the hollow shaft has to guide the solid shaft or, for any other reason, close out-of-round tolerance referenced to a point on the gear housing (such as a flange, for instance) is required.

### Shrink disc coupling

A shrink disc coupling (SSV) can transmit high torque from the non-grooved hub to the smooth shaft. The SSV is easily secured and released, using commercially available bolts. SSVs are the ideal supplement for shaft mount gears. The maximum transmittable torque for the selected shrink discs when fitted and mounted according to instructions is above the starting torque of the respective motors classified as standard (for classification of shrink disc sizes see chapter 11, 12, 13 "Additional dimensional drawings for Shrink disc coupling).

### Torque restraint

Shaft-mounted geared motors require a suitable torque restraint to resist the reaction torque. Shaft-mounted gears have cast torque arms as standard. Bevel gears and worm gears are available with bolt-on torque arms on request. The torque arm is screwed onto the front "V" on the side of the gear unit. It is always important to ensure that the torque arm does not create excessive constraining forces due to the driven shaft running untrue, for example. Excessive play can result in excessive shock torques in switching or reversing operations. Consequently, we recommend the use of pre-tensioned rubber damping elements. These rubber buffers are part of the scope of supply for designs with a torque arm (see chapter 11, 12, 13 dimensional drawings "Rubber buffer for torque restraint").

### Notes for installing shaft mount gears with hollow shaft and keyway

#### (1) Attaching the hollow shaft to the customer shaft

Threaded bolt (d) is screwed into the end thread of the shaft to be driven. By tightening the nut, apply force to thrust plate (b) and locating ring (c) to draw the gear unit onto the shaft.

#### (2) Axial fastening

Pressure piece (b) is rotated and fitted against retaining ring (c) using fixing screw (a).

#### (3) Removing

Extractor (f) is fitted between the end face of the shaft and retainer ring (c). Tighten press-off screw (e) against the end of the shaft and pull the gear unit off the shaft.

Manufacturing drawings for the required parts are available on request. These parts are not included in the scope of supply.

Detailed information on shaft-mounted gear units, bevel-gear units and worm-gear units is available (see chapter 11, 12., 13 dimensional drawings "Tools for fitting shaft-mounted gear with hollow shaft and keyway").

### Gear ventilation

The lifetime of the gearbox lubricant increases the better it is protected from negative environmental influences. Should the oil level or the gearbox ratio cause a very high lubricant temperature, the gearbox will be supplied as standard with a breather plug. Either on request or for corresponding high ambient temperatures, all gearboxes from size 10 can be supplied with a breather plug.

For the position of the threaded plugs see chapter 5 threaded plugs.

### Output shaft seals

All size 10 and larger gears are available with double seals for the output shaft on request and at extra cost. Double seals are particularly effective if the output shaft points down and as protection against external influences

### Lubricants

The drives are shipped ready-filled with gear lubricant. Lubricated in this way, the gear units are suitable for ambient temperatures in the range -20°C to + 40°C. The quantity of lubricant is optimised for the desired installed position as is stated on the nameplate. The type of lubricant is stated in the Operating Instructions. Lubricants for other temperature ranges or special applications available on request.

Wear-protective EP gear oils as indicated in the following table have proven particularly effective:

[...] European Waste Catalogue Code (Decision 2001/118/CE)

### **Important:**

Synthetic gear oils of a Polyglykol base (e.g. PGLP...) must be disposed of separately to mineral oil as **Special Waste** .

So long as the ambient temperature does not fall below  $-20\text{ °C}$  the international definition of the viscosity class at  $40\text{ °C}$  according to ISO 3448 and DIN 51519 ISO the viscosity class VG220 (SAE90) is recommended according, in North America AGMA 5EP.

For lower temperatures it is recommended to use oils of a lower nominal viscosity with a corresponding better starting characteristic, for instance a PGLP with a nominal viscosity VG68 (SAE80) or AGMA 2EP respectively. These types of oil can already be necessary at a temperature around the freezing point, if the break away torque of a drive is reduced by some smooth starting device or if the motor has a relatively low power.

### **Lubricant quantities**

5

The preferred quantity of lubricant for the planned type of installation is stated on the motor's rating plate (symbol "oil can"). When topping up care should be taken to ensure that, depending on the fitting position, gearwheels and rolling contact bearings positioned at the top are also properly oiled. In special versions the oil level mark should be noted. Information about the quantity of lubricant required for other types of installation can be obtained from the factory.

### Lubrication quantity for intermediate gear

#### Definition of the terminal box position

Terminal box position for intermediate gear is similar to the main gearbox that means  
 Main gearbox BG, BF terminal box pos. I -> intermediate gearbox terminal box pos. I  
 Main gearbox BK, BS terminal box pos. II -> intermediate gearbox terminal box pos. II

5

AC Line Operated

---

6

### Sizes

Bauer BG-series helical-geared motors are available in 13 standard sizes with torques from 20 Nm to 18,500 Nm. Higher torques are available on request. The geared unit is accommodated in a sturdy cast housing.

### Bauer service factors ( $f_B$ ) for helical-geared motors

Of the numerous factors influencing the total loading of a geared unit, the most important include:

- Mean torque (rated torque)
- Daily operating hours
- Severity of torque peaks (shock classification)
- Frequency of torque peaks (switching duty)

These factors can be represented in a simplified and practical manner by **service factors**. The tables and explanations below aim to provide an objective description of the **shock classification**, rather than a classification of the driven machinery. Experience has shown that, in addition to the torque shocks caused by the driven machinery ( $M_s/M_N$ ), above all the power transmission components (clutches, chains etc.) plus the mass ratios play a decisive role in this.

See Bauer special imprint SD32 for more information (available on request).

### Continuous operation without switching frequency $Z \leq 1/h$

#### Factor $f_1$ for shock classification and operating time

Shock classification	Operating hours per day $t_d$	>4 h	>8 h	>16 h
		$\leq 8$ h	$\leq 16$ h	$\leq 24$ h
I		0,8	1,0	1,2
II		1,05	1,25	1,45
III		1,45	1,55	1,7

### Switching duty

#### Factor $f_2$ for shock classification and switching frequency

Switching frequency in single-shift operation  $t_d \leq 8$  h/d

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	0,95	1,1	1,15
II	1,2	1,35	1,4
III	1,55	1,6	1,6

Switching frequency in multiple-shift operation  $t_d > 8$  h/d

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	1,3	1,45	1,5
II	1,5	1,6	1,65
III	1,75	1,8	1,8

### Bauer service factor

Bauer service factor  $f_B = f_1$  or  $f_B = f_2$

For example: Shock classification II for  $Z = 100$  switching operations per hour and multiple-shift operation yields a service factor  $f_B = f_2 = 1.5$

# BG-series helical-geared motors

## Description of helical-geared units

### Explanation of shock classification

#### Shock classification I:

Uniform without shock loads. All the following requirements must be satisfied:

- $FI \leq 1,3$
- $M_x/M_N \leq 1,0$
- Shock-absorbing power transmission components (e.g. highly resilient, zero-play coupling,  $\varphi N \geq 5^\circ$ )

#### Shock classification II:

Moderate shock loads. At least one of the following conditions applies:

- $1,3 < FI \leq 4$
- $1 < M_x/M_N \leq 1,6$
- Shock-neutral power transmission components (e.g. gear wheels, zero-play rigid coupling or resilient coupling with  $\varphi N < 5^\circ$ )

#### Shock classification III:

Heavy shock loads. At least one of the following conditions applies:

- $FI > 4$
- $1,6 < M_x/M_N \leq 2,0$
- Shock-amplifying power transmission components (e.g. coupling with play or chain drive)

### Key to abbreviations

Z	Switching duty number of switching operations per hour
$t_d$	Daily operating time in hours (h/d)
FI	Factor of inertia $FI = (J_{ext} + J_{rot})/J_{rot}$
$J_{ext}$	Mass moment of inertia of the machine to be driven, in relation to the motor's rotor shaft (kgm <sup>2</sup> )
$J_{rot}$	Mass moment of inertia of the motor rotor (kgm <sup>2</sup> )
$M_x$	Highest impact torque above the static torque which can occur during normal operation or in emergency situations
$M_N$	Required static load torque for the application
$M_x/M_N$	Relative torque - Factor
$\varphi_N$	Torsional offset of the resilient coupling under rated torque

### Selection tables, helical-geared motors

#### Key to abbreviations

P	Rated output Power
$n_2$	Rated speed of the output shaft
i	Gear reduction ratio
$M_2$	Rated torque at the output shaft
$f_B$	Bauer service factor
$F_{RN}$	Maximum permissible radial force with a standard solid shaft (Code -.1 and -.7)
$F_{RV}$	Maximum permissible radial force with reinforced bearings in each case with standard solid shaft (Code -.1 and -.7)

Use the selection tables to determine the size of geared motor required. The codes clearly define the Type of gear (see chapter 10 "dimensional drawings, helical-geared motors").

#### Motor power overload protection

Motor-power ratings, particularly in conjunction with four-stage and multi-stage gear units, are more than ample in some instances. Consequently, and in much the same way as with low-power motors, rated current is not a measure of gear loading and cannot be used to protect the gear unit against overloading. It is advisable to provide gears at risk from excessive load or blockage with a protective mechanism (e. g., slip clutch, slip hub, shear pin or an alternative).

# BF-series shaft-mounted geared motors

## Description of shaft-mounted gear units

### Sizes

Bauer BF-series shaft-mounted geared motors are normally supplied in ten frame sizes and with torques of 90 to 18,500 Nm. Higher torques are available on request. The gear unit is accommodated in a sturdy cast housing

### Bauer service factors ( $f_B$ ) for shaft-mounted geared motors

Of the numerous factors influencing the total loading of a gear unit, the most important include:

- Mean torque (rated torque)
- Daily operating hours
- Severity of torque peaks (shock classification)
- Frequency of torque peaks (switching duty)

These factors can be represented in a simplified and practical manner by **service factors**. The tables and explanations below attempt to provide an objective description of the **shock classification**, rather than a classification of the driven machinery. Experience has shown that, in addition to the torque shocks caused by the driven machinery ( $M_K/M_N$ ), above all the power transmission components (clutches, chains etc.) plus the mass ratios play a decisive role in this.

See Bauer special imprint SD32 for more information.

### Continuous operation without switching frequency $Z \leq 1/h$

#### Factor $f_1$ for shock classification and operating time

Shock classification	Operating hours per day $t_d$		
	>4 h ≤8 h	>8 h ≤16 h	>16 h ≤24 h
I	0,8	1,0	1,2
II	1,05	1,25	1,45
III	1,45	1,55	1,7

### Switching duty

#### Factor $f_2$ for shock classification and switching frequency

Switching frequency in single- shift operation  $t_d \leq 8 h/d$

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	0,95	1,1	1,15
II	1,2	1,35	1,4
III	1,55	1,6	1,6

Switching frequency in multiple- shift operation  $t_d > 8 h/d$

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	1,3	1,45	1,5
II	1,5	1,6	1,65
III	1,75	1,8	1,8

### Bauer service factor

Bauer Service factor  $f_B = f_1$  or  $f_B = f_2$

For example: Shock classification II for  $Z = 100$  switching operations per hour and multiple-shift operation yields a service factor  $f_B = f_2 = 1.5$

### Explanation of shock classification

#### Shock classification I:

Uniform without shock loads. All the following requirements must be satisfied:

- $F_I \leq 1,3$
- $M_K/M_N \leq 1,0$
- Shock-absorbing power transmission components (e.g. highly resilient, zero-play coupling,  $\varphi \geq 5^\circ$ )

# BF-series shaft-mounted geared motors

## Description of shaft-mounted gear units

### Shock classification II:

Moderate shock loads. At least one of the following conditions applies:

- $1,3 < FI \leq 4$
- $1 < M_x/M_N \leq 1,6$
- Shock-neutral power transmission components (e.g. gear wheels, zero-play rigid coupling or resilient coupling with  $\varphi_N < 5^\circ$ )

### Shock classification III:

Heavy shock loads. At least one of the following conditions applies:

- $FI > 4$
- $1,6 < M_x/M_N \leq 2,0$
- Shock-amplifying power transmission components (e.g. coupling with play or chain drive)

### Key to abbreviations

Z	Switching duty number of switching operations per hour
$t_d$	Daily operating time in hours (h/d)
FI	Factor of inertia $FI = (J_{ext} + J_{rot})/J_{rot}$
$J_{ext}$	Mass moment of inertia of the machine to be driven, in relation to the motor's rotor shaft (kgm <sup>2</sup> )
$J_{rot}$	Mass moment of inertia of the motor rotor (kgm <sup>2</sup> )
$M_x$	Highest impact torque above the static torque which can occur during normal operation or in emergency situations
$M_N$	Required static load torque for the application
$M_x/M_N$	Relative torque - Factor
$\varphi_N$	Torsional offset of the resilient coupling under rated torque

7

### Selection tables, shaft-mounted geared motors

### Key to abbreviations

P	Rated output
$n_2$	Rated speed of the output shaft
i	Gear reduction ratio
$M_2$	Rated torque at the output shaft
$f_B$	Bauer service factor
$F_{RN}$	Maximum permissible radial force with normal bearings
$F_{RV}$	Maximum permissible radial force with reinforced bearings in each case with standard solid shaft (Code -.1 und -.2)

Use the selection tables to determine the size of geared motor required. The codes clearly define the Type of gear unit and output shaft (see chapter 11 „dimensional drawings shaft-mounted gear motors“).

### Motor power overload protection

Motor-power ratings, particularly in conjunction with four-stage and multi-stage gear units, are more than ample in some instances. Consequently, and in much the same way as with low-power motors, rated current is not a measure of gear loading and cannot be used to protect the gear unit against overloading. It is advisable to provide gears at risk from excessive load or blockage with a protective mechanism (e. g., sliding clutch, sliding hub, shear pin or an alternative).

# Energy Efficient Geared Motors

AC Line Operated

---

8

### Sizes

Bauer BK-series bevel-gear motors are normally supplied in ten frame sizes and with torques of 80 to 18,500 Nm. Higher torques are available on request. The gear unit is accommodated in a sturdy cast housing

### Bauer service factors ( $f_B$ ) for bevel-gear motors

Of the numerous factors influencing the total loading of a gear unit, the most important include:

- Mean torque (rated torque)
- Daily operating hours
- Severity of torque peaks (shock classification)
- Frequency of torque peaks (switching duty)

These factors can be represented in a simplified and practical manner by service factors. The tables and explanations below attempt to provide an objective description of the shock classification, rather than a classification of the driven machinery. Experience has shown that, in addition to the torque shocks caused by the driven machinery ( $M_s/M_N$ ), above all the power transmission components (clutches, chains etc.) plus the mass ratios play a decisive role in this.

See Bauer special imprint SD32 for more information.

### Continuous operation without switching frequency $Z \leq 1/h$

**Factor  $f_1$**  for shock classification and operating time

Shock classification	Operating hours per day $t_d$	>4 h	>8 h	>16 h
		$\leq 8$ h	$\leq 16$ h	$\leq 24$ h
I		0.8	1.0	1.2
II		1.05	1.25	1.45
III		1.45	1.55	1.7

### Switching duty

**Factor  $f_2$**  for shock classification and switching frequency

Switching frequency in single- shift operation  $t_d \leq 8$  h/d

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	0.95	1.1	1.15
II	1.2	1,35	1.4
III	1.55	1.6	1.6

Switching frequency in multiple- shift operation  $t_d > 8$  h/d

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	1.3	1.45	1.5
II	1.5	1.6	1.65
III	1.75	1.8	1.8

### Bauer Service factor

Bauer service factor  $f_B = f_1$  or  $f_B = f_2$

For example: Shock classification II for  $Z = 100$  switching operations per hour and multiple-shift operation yields a service factor  $f_B = f_2 = 1.5$

# BK-series bevel-gear motors

## Description of bevel-gear units

### Explanation of shock classification

#### Shock classification I:

Uniform without shock loads. All the following requirements must be satisfied:

- $FI \leq 1.3$
- $M_x/M_N \leq 1.0$
- Shock-absorbing power transmission components (e.g. highly resilient, zero-play coupling,  $\varphi_N \geq 5^\circ$ )

#### Shock classification II:

Moderate shock loads. At least one of the following conditions applies:

- $1.3 < FI \leq 4$
- $1 < M_x/M_N \leq 1.6$
- Shock-neutral power transmission components (e.g. gear wheels, zero-playrigid coupling or resilient coupling with  $\varphi_N < 5^\circ$ )

#### Shock classification III:

Heavy shock loads. At least one of the following conditions applies:

- $FI > 4$
- $1.6 < M_x/M_N \leq 2.0$
- Shock-amplifying power transmission components (e.g. coupling with play or chain drive)

### Key to abbreviations

Z	Switching duty number of switching operations per hour
$t_d$	Daily operating time in hours (h/d)
FI	Factor of inertia $FI = (J_{ext} + J_{rot})/J_{rot}$
$J_{ext}$	Mass moment of inertia of the machine to be driven, in relation to the motor's rotor shaft ( $kgm^2$ )
$J_{rot}$	Mass moment of inertia of the motor rotor ( $kgm^2$ )
$M_x$	Highest impact torque above the static torque which can occur during normal operation or in emergency situations
$M_N$	Required static load torque for the application
$M_x/M_N$	Relative torque - Factor
$\varphi_N$	Torsional offset of the resilient coupling under rated torque

### Selection tables, bevel-gear motors

#### Key to abbreviations

P	Rated output
$n_2$	Rated speed of the output shaft
i	Gear reduction ratio
$M_2$	Rated torque at the output shaft
$f_B$	Bauer service factor
$F_{RN}$	Maximum permissible radial force with normal bearings
$F_{RV}$	Maximum permissible radial force with reinforced bearings in each case with standard solid shaft (Code -.1 and -.2)

Use the selection tables to determine the size of geared motor required. The codes clearly define the Type of gear unit and output shaft (see chapter 12 "dimensional drawing bevel-gear motors").

#### Motor power overload protection

Motor-power ratings, particularly in conjunction with four-stage and multi-stage gear units, are more than ample in some instances. Consequently, and in much the same way as with low-power motors, rated current is not a measure of gear loading and cannot be used to protect the gear unit against overloading. It is advisable to provide gears at risk from excessive load or blockage with a protective mechanism (e. g., slip clutch, slip hub, shear pin or an alternative).

# Energy Efficient Geared Motors

AC Line Operated

---

**Sizes** Bauer BS-series worm-geared motors are normally supplied in eight frame sizes and with torques of 25 to 1,000 Nm. Higher torques are available on request. The gear unit is accommodated in a sturdy cast housing.

**Efficiency** The efficiency of worm-geared motors depends on numerous factors, including lubrication, extent of wear, temperature and vibration. Calculated efficiency, therefore, is merely a guideline value. Please consult BAUER and state the boundary conditions if efficiency or self-locking capability are important factors for your application.

**Bauer service factors ( $f_b$ ) for worm-geared motors** Worm gears transmit torque by sliding friction only, which means that losses and temperature are inevitably higher than with helical-gear arrangements.

Of the numerous factors influencing the total loading of a worm-gear unit, the most important include:

- Mean torque (rated torque)
- Daily operating hours
- Severity of torque peaks (shock classification)
- Frequency of torque peaks (switching duty)
- Ambient temperature

These factors can be represented in a simplified and practical manner by **service factors**. The tables and explanations below attempt to provide an objective description of the **shock classification**, rather than a classification of the driven machinery. Experience has shown that, in addition to the torque shocks caused by the driven machinery ( $M_v/M_N$ ), above all the power transmission components (clutches, chains etc.) plus the mass ratios play a decisive role in this.

See Bauer special imprint SD32 for more information.

**Continuous operation without switching frequency  $Z \leq 1/h$**

**Factor  $f_1$**  for shock classification and operating time

Shock classification	Operating hours per day $t_d \leq 10$ min	$\leq 1$ h	$> 1$ h	$> 4$ h	$> 8$ h	$> 16$ h
			$\leq 4$ h	$\leq 8$ h	$\leq 16$ h	$\leq 24$ h
I	0,7	0,8	0,9	1,0	1,25	1,4
II	0,9	1,0	1,12	1,25	1,6	1,8
III	1,25	1,4	1,6	1,8	2,2	2,5

# BS-series worm-geared motors

## Description of worm-gear units

### Switching duty

**Factor  $f_2$**  or shock classification and switching frequency

Switching frequency in single- shift operation  $t_d \leq 8$  h/d

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	1,25	1,4	1,6
II	1,6	1,8	2,0
III	1,8	2,0	2,2

Switching frequency in multiple- shift operation  $t_d > 8$  h/d

Shock classification	$1 < Z \leq 100$	$100 < Z \leq 1000$	$1000 < Z$
I	1,4	1,6	1,8
II	1,8	2,0	2,2
III	2,0	2,2	2,5

### Ambient temperature

**Factor  $f_3$**  for increased ambient temperature

AT	-10°C .. +25°C	>25°C	>30°C	>35°C	>40°C	>45°C	>50°C	>55°C
	no Factor	1,1	1,2	1,3	1,4	1,5	1,6	Enquiry

### Bauer service factor

Bauer service factor  $f_B$  = maximum value  $f_1, f_2, f_3$  (at daily operating hours > 1h)

For example: Shock classification II for  $Z = 100$  switching operations per hour and multiple-shift operation yields a service factor  $f_B = f_2 = 1,8$

### Explanation of shock classification

#### Shock classification I:

Uniform without shock loads. All the following requirements must be satisfied:

- $FI \leq 1,3$
- $M_x/M_N \leq 1,0$
- Shock-absorbing power transmission components (e.g. highly resilient, zero-play coupling,  $\varphi N \geq 5^\circ$ )

#### Shock classification II:

Moderate shock loads. At least one of the following conditions applies:

- $1,3 < FI \leq 2$
- $1 \leq M_x/M_N \leq 1,4$
- Shock-neutral power transmission components (e.g. gear wheels, zero-playrigid coupling or resilient coupling with  $\varphi N < 5^\circ$ )

#### Shock classification III:

Heavy shock loads. At least one of the following conditions applies:

- $FI > 2$
- $1,4 < M_x/M_N \leq 2,0$
- Shock-amplifying power transmission components (e.g. coupling with play or chain drive)

### Key to abbreviations

Z	Switching duty number of switching operations per hour
$t_d$	Daily operating time in hours (h/d)
FI	Factor of inertia $FI = (J_{ext} + J_{rot})/J_{rot}$
$J_{ext}$	Mass moment of inertia of the machine to be driven, in relation to the motor's rotor shaft ( $\text{kgm}^2$ )
$J_{rot}$	Mass moment of inertia of the motor rotor ( $\text{kgm}^2$ )
$M_x$	Highest impact torque above the static torque which can occur during normal operation or in emergency situations
$M_N$	Required static load torque for the application
$M_x/M_N$	Relative torque - Factor
$\varphi_N$	Torsional offset of the resilient coupling under rated torque
UT	Ambient temperature ( $^{\circ}\text{C}$ )

### Selection tables, worm-geared motors

#### Key to abbreviations

P	Rated output
$n_2$	Rated speed of the output shaft
i	Gear reduction ratio
$M_2$	Rated torque at the output shaft
$f_B$	Bauer Service factor
$F_{RN}$	Maximum permissible radial force with standard solid shaft (Code -.1 und -.2)

Use the selection tables to determine the size of geared motor required. The codes clearly define the Type of gear unit and output shaft (see chapter 13 "dimensional drawings worm-geared motors").

#### Motor power overload protection

Motor-power ratings, particularly in conjunction with four-stage and multi-stage gear units, are more than ample in some instances. Consequently, and in much the same way as with low-power motors, rated current is not a measure of gear loading and cannot be used to protect the gear unit against overloading. It is advisable to provide gears at risk from excessive load or blockage with a protective mechanism (e. g., slip clutch, slip hub, shear pin or an alternative).

### ErP Directive 2009/125/EC

Directive 2009/125/EC of the European Parliament and the Council, issued in 2009, specifies requirements for the environmentally responsible design of energy-related products (ErPs). In November 2009 it superseded Directive 2005/32/EC, which formed the framework for requirements for the environmentally responsible design of energy-using products (EuPs). This change has no effect on already proclaimed implementation measures.

#### Objectives

The ErP Directive has several objectives:

##### 1. Mitigating the environmental impact of energy-using products

This objective is intended to be achieved by the documentation and labelling of products, by regulations for inspection, and by the formulation of individual requirements in implementation measures. As the entire product life cycle is taken into consideration, action must be taken as early as the design phase.

##### 2. Climate protection

Achievement of the EU climate protection objectives is to be supported. This can be implemented by reducing energy consumption and the emission of global warming gasses in the production, operation and disposal of energy-using products.

##### 3. Harmonised legislation

The directive creates a framework for the European regulation of environmental design requirements. This avoids trade impediments resulting from differences in national regulations. This can be achieved by means of the proclamation of legally binding implementation measures for the entire Community and protection of free trade in goods against further-reaching regulations of the Member States.

### Which motors are excluded from the scheme?

- Motors designed to be operated completely immersed in a liquid
- motors fully integrated into a product (e.g. a gearbox, a pump, a fan or a compressor) whose energy efficiency cannot be measured independently of that product
- at altitudes above 4000 meters above sea level
- at ambient temperatures above 60 °C
- at ambient temperatures below - 30 °C (any motor) or at ambient temperatures below 0 °C (air-cooled motor)
- in potentially explosive atmospheres within the meaning of Directive 94/9/EC of the European Parliament and of the Council
- Brake motors

### Example:

### Regulation (EU) 2019/1781

To establish eco-design requirements for electric motors and variable speed drives pursuant to Directive 2009/125/EC

#### Valid from: 01.07.2021

- Frequency converter 0.12 - 1,000 kW: IE2
- 3-phase motors 0.12 < 0.75 kW/2.4, 6 or 8 poles: IE2 (Excluded: Ex eb (DXE))
- 3-phase motors 0.75 - 1,000 kW/2.4, 6 or 8 poles: IE3 (Excluded: Ex eb (DXE))

#### ATTENTION:

Brake motors are no longer exempt!!  
IE2 for inverter operation is no longer permitted!!!

#### Valid from: 01.07.2023

- 1-phase motors  $\geq 0.12$  kW: IE2
- Ex eb (DXE) Motors  $\geq 0.12$  kW: IE2
- 3-phase motors 75 kW – 200 kW 2, 4 or 6 pole: IE4  
(Exempt: brake motor and all explosion-proof motors)

#### Scope

Induction electric motors without brushes, commutators, slip rings or electrical connections to the rotor, rated for operation on a 50 Hz, 60 Hz or 50/60 Hz sinusoidal voltage and having the following characteristics:

- 2-, 4-, 6- and 8-pole motors
- Rated power  $P_N$  between 0.12 kW and 1000 kW
- Rated voltage  $U_N$  over 50 V up to and including 1,000 V
- are designed for continuous operation ( $S_1$ ,  $S_3 \geq 80$  % ED,  $S_6 \geq 80$  % ED) and are intended for direct mains operation

### Which engines are excluded from the scheme?

- Motors designed to be operated completely immersed in a liquid
- Motors fully integrated into a product (e.g. a gearbox, a pump, a fan or a compressor) whose energy efficiency cannot be measured independently of that product
- Motors with integrated frequency converter (compact drives) whose energy efficiency cannot be tested independently of the frequency converter
- Motors specifically designed and specified to operate exclusively
  - at altitudes exceeding 4000 m above sea-level
  - at ambient temperatures above 60 °C
  - at ambient temperatures below -30 °C
- Motors with integrated brake, which is an integral part of the inner motor construction and cannot be removed or supplied from a separate power source when testing the motor efficiency.
- Motors specifically qualified for the safety of nuclear installations, as defined in Article 3 of Council Directive 2009/71/EURATOM
- Motors with mechanical commutators
- Totally enclosed Non-Ventilated motors (TENV)
- Engines from the respective scope of application of the two deadlines 01.07.2021 or 01.07.2023, which were placed on the market before these deadlines, may continue to be placed on the market until 30.06.2029 as 1:1 replacements and may be specifically marketed as such
- Multi-speed motors, i.e. pole-changing motors
- Motors designed specifically for the traction of electric vehicles
- Motors in portable equipment whose weight is supported by hand during operation
- Motors in hand-held mobile equipment which are moved during operation
- Motors in cordless or battery-operated equipment
- Motors for underground mining (mines)

### Method for determining the motor efficiency according to IEC 60034-2-1

Individual loss procedure

Additional losses according to residual loss method

Low measurement uncertainty

Bauer geared motors for connection to three-phase supply are supplied with specially designed induction motors. This design ensures maximum operating safety with high breakaway torque and minimum starting current.

The torque/speed characteristic is largely free of torque dips. Torque is optimised to suit requirements and application parameters. See "www.bauergears.com" for more information.

### Torques

The torques as stated in the selection tables are fully available at the output shaft. These figures apply for continuous operation (S1-100 %) at a maximum ambient temperature of 40 °C and at site elevations up to 1000 m above sea level. Drives for higher ambient temperatures and site elevations are available on request. Gear efficiencies, which are lower than the usual values for spur gears, are taken into account in the torques listed in the selection tables.

### Line voltages

BAUER motors are available as standard for the following three-phase line voltages:

Motor size	Standard voltages:
D..04LA4 - D09X.4	220 V Δ/ 380 V Y 50 Hz
0.06 - 2.2 kW	230 V Δ/ <b>400 V Y 50 Hz*</b>
	240 V Δ/415 V Y 50 Hz**
	440 V Y/60 Hz 460 V Y/60 Hz
from D..11SA4	220 V Δ/ 380 V Y 50 Hz
from 3.0 kW	230 V Δ/ 400 V Y 50 Hz
	240 V Δ/ 415 V Y 50 Hz**
	440 V Y/60 Hz 460 V Y/60 Hz
	380 V Δ/ 660 V Y 50 Hz
	<b>400 V Δ/ 690 V Y 50 Hz*</b>
	415 V Δ/50 Hz**
	440 V Δ/ 60 Hz
	460 V Δ/ 60 Hz

\*Voltage recommended world-wide by IEC 38 and in Europe by CENELEC.

\*\*= Insulation Class F is necessary.

Designs for other voltages available on request and at extra cost.

Unless otherwise specified, motors for operation in conjunction with frequency converters with a 50 or 60 Hz frequency have a Y-circuit to optimise operating noise and winding load.

Unless otherwise stated, the tolerance for the rated voltage is +/- 5 %, in accordance with IEC 60034-1.

The D..04.. to D..18.. motors in 4 pole design can be operated within a tolerance of +/- 10 % of the rated voltage (400 V 50 Hz).

### Line frequencies

All motors are available with the same power ratings for either 50 or 60 Hz. Increased power models are available on request.

### Rating plate

Bauer geared motors are supplied with a corrosion-proof rating plate as standard. The standard rating plate is made of special plastic tried and tested in many years of practical use and approved for hazardous areas by the Physikalisch-Technische-Bundesanstalt (PTB).

### Terminal box

The cables of motors with and without brakes can be introduced into the motor terminal box from side A or side C.

The standard position for the motor terminal box is shown in the dimensional drawings for the geared motors (see chapter 10,11,12 and 13). The terminal box can be installed at any of 3 other positions on request, if on-site space is restricted. The 4 possible positions are 90° offsets around the axis of the motor (dimensional drawing and designation for standard terminal box, see chapter 16 "Dimensional drawing standard terminal box").

Cast-on terminal boxes (KAG) are supplied with knock out entries with metric nut for cable gland. Screw- on terminal boxes (TBI...4 are supplied with a metric screw thread as standard.

### Motor connections

The electrical connection of gear motors is time consuming and creates costs, which cannot be neglected both during initial installation and in service cases. These costs are reduced considerably by the use of BAUER Gear Motors, have CAGE CLAMP® connection technology instead of the conventional terminal block – and that without extra charge.

### What are the advantages for you ?

#### Cost reduction during connection

Public timing test have confirmed, that the electrical connection of a cable by means of CAGE CLAMP® technology saves up to 75 % working time compared with the classic screw connection.

#### Simple Handling

Cable connection from the top, very easily accessible: The CAGE CLAMP® spring is pressed, and the cable inserted from the front, i.e. in the field of vision of the installation engineer.

#### Which cable core diameters ?

Suitable for all copper wires from 0.5 mm<sup>2</sup> to 25 mm<sup>2</sup>.

#### Cost saving in material and tooling

- multicore cable ends, cable eyes or cable ring eyes are no longer needed
- Tools such as crimping pliers are no longer needed
- Inadvertently over tightening or breaking of the terminal bolts and the procurement of a new terminal block belong in the past.
- Searching and procurement of nuts and washers for the terminal blocks, which have fallen down, also belongs in the past.

#### Vibration and shock resistant

Vibration and shock result neither in conductor damage nor in a measurable contact interruption. The connection is service free.

#### Type of conductors

The CAGE CLAMP®-connector can clamp fine stranded, stranded and solid cores wires.

### Terminal connections for single speed motors

Standard connection of three phase motors via CAGE CLAMP®.  
D..04 - D..09

D..11 - D..18

### Terminal connections for single speed motors with thermal motor protection

Standard connection of three phase motors with thermal motor protection via CAGE CLAMP®.

D..04.. - D..09..

Connection of three-phase motor and thermal motor protection via CAGE CLAMP®

ZK	Optimal additional connection		

### Plug-and-socket connection

D..06.. to D..16.. Bauer motors are available with plug-in motor connection. The socket housing is mounted on the fan-cowl side of the terminal box as standard. This layout minimises the protrusion caused by the plug.

The standard plug-and-socket type connection incorporates the attachment housing, pin insert and cover. Grommet-type housings and jack inserts are available on request at extra cost. Pin assignments on request (dimensional drawing, see chapter 17 "Dimensional drawing, plug-connector terminal box").

A design with single clamp lever according to the DESINA regulation of the „Verbandes Deutscher Werkzeugmaschinenhersteller“ (VDW) is also available.

The motors are also available with a low-cost round plug connector as an alternative. This is fitted at the factory in the standard terminal box and is also suitable for brake connection, thermistors and thermostats. Additional information on request.

Bauer motors from D..08.. with motor-mounted brake are also available with plug-in brake connection. This means that if it requires attention, the brake can be replaced on site with no loss of time.

# Motors

## General

### Motor protection

Each geared motor requires a current-dependent motor protection switch or an overcurrent relay with thermal delay in the switchgear to protect the motor windings. The rated motor currents required for settings are stated in the order acknowledgment. Thermal protection for the winding is recommended as an additional safety measure for special operating conditions (short-time or intermittent periodic duty, high switching frequency, severe voltage fluctuations or restricted cooling) and for operation in conjunction with a frequency converter.

### Thermistors (PTC)

Thermistors are temperature-dependent resistors which are fitted in each phase winding. In conjunction with a motor protection switch, they ensure optimum protection for the winding in the event of rapid temperature rise. Characteristic to DIN 44081 and "Mark A" to IEC 34-11-2. Thermistors are available for all motors at extra cost. The requisite monitoring device is not included in the scope of supply.

### Thermostatic protection

Bimetal switches are used for slow-acting, independent temperature monitoring and are embedded in each winding section of the motor.

The bimetal disc is sized such that when the temperature rises above a specific, previously set value, the disc suddenly snaps from a convex state to a concave state and the contact moves vertically away from the contact plate. In this state the switch is either open (normally closed switch) or closed (normally open switch). A significant temperature change is necessary to allow the bimetal disc to independently snap back to its initial position. When it does, the switch is again closed (normally closed switch) or open (normally open switch). Thermal protection switches are available for all motors at additional cost. For technical reasons, this option is not recommended for large motors (D..11.. to D..18..).

# Motors

## General

### KTY sensors

KTY sensors with heat-shrink insulation can be used to measure and monitor critical surface temperatures and internal temperatures of motors and machines. These sensors are suitable for use in harsh industrial environments in all places where accurate measurements with a single sensor are required. KTY sensors are available for all types of motors at additional cost.

Type 84-130SH: primarily installed in motors that are operated with Siemens frequency converters.

Working principle: KTY sensors are temperature-dependent components. The resistance of the KTY sensor increases when its temperature rises. The characteristic curve is nearly linear in the sensor's measuring range; the reference resistance (at 100 °C) is 970 to 1030 ohms.

### PT100 sensors

Precise monitoring of motor temperatures is necessary in many fields of industry. Pt100 sensors feature high accuracy, short response time and long-term stability, and they are suitable for use over a wide range of temperatures. Pt100 sensors are available for all motor types at additional cost.

#### Specifications

Nominal resistance: 100  $\Omega$  at 0 °C

The resistance characteristics are specified in EN 60751.

# Motors

## General

### Insulation

The gearmotors described in the selection tables of this catalogue with the motor sizes D..04., D..05., D..06., D..08., D..09S and D..09L are executed in insulation class B. Temperature class F is available on request at extra cost.

4-pole motors D..07.. and D..09XA4 (2.2 kW) to D..18XA4 (30 kW) and all multi-speed motors are rated in Temperature Class F as standard.

Insulation Class F bestows the winding a multiple protection against high humidity, acidic gases and heavy tropical influences while making the same shock resistant and more resistant to heat. Protection against insects (termites) is guaranteed through the complete enclosure (IP65) as long as the mains cables are encased in metal.

### IP – Protection classes

Bauer motors from motor size D..06.. are manufactured to IP65 degree of protection as standard. Motor sizes D..04.. and D..05.. have a smooth motor housing of IP54. Higher IP protection classes on request.

### Degrees of protection provided by enclosures for electrical equipment

First IP - code number after DIN EN 60529				Second IP - code number after DIN EN 60529

### Speed of output shaft

The rated speeds in the selection tables are guidelines for load at rated power. Speed can vary depending on degree of load and temperature (particularly in the case of relatively small motors). Combination gear units for lower speeds are available on request.

# Motors

## Duty types as defined by EN 60034

### General

Aside from special drives (such as lifting equipment), standard motors are always designed for continuous running duty. If the drive is operated with frequent on/off cycles, it may be necessary to select a larger motor with a special design. On the other hand, with pronounced short-time duty it is often possible to select a smaller model. **For this reason, it is technically necessary or economically advantageous to inform the motor manufacturer of any duty type that differs from continuous running.**

### Continuous running duty (S1)

Operation under rated load for sufficient time to allow temperature equilibrium to be attained, such that the temperature does not increase any more with continued operation. The equipment can operate continuously under the rated load without exceeding the allowable temperature.

### Short-time duty (S2)

The operating time under rated load is short compared with the subsequent rest period. The standard operating times are 10, 30, 60 and 90 minutes. The equipment can operate for this period under the rated load without exceeding the allowable temperature.

Example: S2 – 60 min

## Intermittent periodic duty (S3)

S3 duty consists of a sequence of identical cycles, each composed of an operating time with constant load and a rest time with the windings de-energised. The cycle is such that the starting current does not significantly affect the temperature rise. The operating time under rated load and the subsequent pause are both short. The equipment can operate under load only during the period indicated by the duty cycle as a percentage of the total cycle time (cycle duration).

The standardised duty cycles are 15, 25, 40 and 60 %. The cycle duration is 10 minutes unless otherwise specified.

Intermittent periodic duty means that a state of thermal equilibrium is not reached during the load interval.

The duty cycle can be determined as follows:

$$ED = \frac{t_N}{t_{cyc}} \times 100\% = \frac{t_N}{t_N + t_0} \times 100\%$$

Example: S3 – 25%

# Motors

## Duty types as defined by EN 60034

### Intermittent periodic duty with starting (S4)

S4 duty consists of a sequence of identical cycles, each of which is composed of a distinct starting time, a time of operation under constant load, and a rest period with the windings de-energised.

The operating time under rated load and the subsequent pause are both short. The equipment can operate under load only during the period indicated by the duty cycle as a percentage of the total cycle time (cycle duration).

The standardised duty cycles are 15, 20, 40 and 60 %. The cycle duration is 10 minutes unless otherwise specified.

The load cycle corresponds to mode S3, but with additional heating during the starting time that must be taken into account.

The duty cycle can be determined as follows:

$$ED = \frac{(t_a + t_N)}{t_{cyc}} \times 100\% = \frac{t_a + t_N}{t_a + t_N + t_0} \times 100\%$$

Example: S4 – 25 %,  $J_M = 0.15 \text{ kgm}^2$

## Intermittent periodic duty with electric braking (S5)

S5 duty consists of a sequence of identical cycles, each of which is composed of a starting time, a time of operation under constant load, a time of fast electric braking, and a rest period with the windings de-energised.

The operating time under rated load and the subsequent pause are both short. The equipment can operate under load only during the period indicated by the duty cycle as a percentage of the total cycle time (cycle duration).

The standardised duty cycles are 15, 20, 40 and 60 %. The cycle duration is 10 minutes unless otherwise specified.

The load cycle corresponds to S3 duty, but with additional warming during the starting time  $t_a$  and the braking time  $t_{Br}$  taken into account.

The duty cycle can be determined as follows:

$$ED = \frac{(t_a + t_N + t_{Br})}{t_{cyc}} \times 100\% = \frac{t_a + t_N + t_{Br}}{t_a + t_N + t_{Br} + t_0} \times 100\%$$

Example: S5 – 25%;  $J_M = 0.15 \text{ kgm}^2$ ,  $J_{ext} = 0.7 \text{ kgm}^2$   
( $J_M$  Moment of inertia of the motor /  $J_{ext}$  Moment of inertia of the load)

### Continuous-operation periodic duty (S6)

This type of duty corresponds to S3, with the exception that the equipment remains energised during the rest periods. In other words, it operates with no load during these periods. The duty cycle and cycle duration are specified the same way as for S3 duty.

The duty cycle can be determined as follows:

$$ED = \frac{t_N}{t_{cyc}} \times 100\% = \frac{t_N}{t_N + t_0} \times 100\%$$

Example: S6 – 40 %

### Continuous-operation periodic duty with electric braking (S7)

The machine starts up, operates under load, and then is braked electrically, for example by feeding it from a DC power source. Following this, it starts up again immediately. The machine can operate continuously in this manner if the specified moments of inertia of the motor  $J_M$  and of the load  $J_{Ext}$  as well as the specified duty cycle are not exceeded. If the cycle duration is not specified, it is assumed to be 10 minutes.

The duty cycle can be determined as follows:  $DC = 1$

Example: S7 –  $J_M = 0.4 \text{ kgm}^2$ ,  $J_{Ext} = 7.5 \text{ kgm}^2$   
( $J_M$  Moment of inertia of the motor /  $J_{Ext}$  Moment of inertia of the load)

### Continuous-operation periodic duty with relative load/speed changes (S8)

The machine runs continuously under variable load with frequent speed variations. The machine can operate continuously in this manner if at each speed the specified values are not exceeded (moments of inertia  $J_M$  and  $J_{Ext}$  cycle duration (if other than 10 minutes), rated output and duty cycle. With a moment of inertia of  $1 \text{ kg m}^2$ , the acceleration characteristics are the same as with a mass of  $1 \text{ kg}$  at a distance of  $1 \text{ m}$  from the axis of rotation).

The duty cycle can be determined as follows:

$$ED = \frac{t_a + t_{N1}}{t_{cyc}} \times 100\% = \frac{t_{Br} + t_{N2}}{t_{cyc}} \times 100\%$$

Example: S8 –  $J_M = 0.5 \text{ kgm}^2$ ,  $J_{Ext} = 6 \text{ kgm}^2$

( $J_M$  Moment of inertia of the motor /  $J_{Ext}$  Moment of inertia of the load)

### Duty with non-periodic load and speed variations (S9)

In S9 duty the load and the speed vary non-periodically within the permissible operating range. This includes frequently applied overloads, which must never exceed the reference load. For this duty type, a constant load appropriately selected and based on duty type S1 shall be taken as the reference value  $M_{ref}$  for the overload.

### Duty with discreet constant loads and speeds (S10)

S10 duty comprises operation with at most four different load levels, each of which is maintained long enough to allow the machine to reach thermal equilibrium.

The minimum load within a duty cycle may have a value of zero (no-load operation or at rest with the windings de-energised).

The appropriate abbreviation is S10 followed by the per unit quantities  $p/\Delta t$  for the respective load and its duration and the per unit quantity  $TL$  for the relative thermal life expectancy of the insulation system. The reference value for the thermal life expectancy is the thermal life expectancy at rating for continuous running duty and permissible limits of temperature rise based on duty type S1. For a time de-energized and at rest, the load shall be indicated by the letter  $r$ .

Example: S10  $p/\Delta t = 1.1/0.4, 1/0.3, 0.9/0.2, r/0.1$ ;  $TL = 0.6$

The figures given in the table below are for Bauer motors operating in conjunction with the frequency inverter. The torques referred to in tables can be entered for the respective frequencies in continuous operation (S1 = duty factor 100 %).

### Notes on design

Use the torque required at the lowest operating speed to select motors for applications which require constant torque over the entire speed range, as is the case, for example, with lifting gear and conveyors. Bear in mind, too, the possibility of torque being lower in the field-weakening range.

Use only the torque required at the highest operating speed to select motors for applications which require square-law torque over the speed range, as is the case, for example, with pumps and fans. Field weakening is not permissible.

The motor's power is frequency-dependent. It can be approximated in kW from torque M in Nm, the 50 Hz or 60 Hz speed n and the frequency f in Hz by means of the equation

$$P = M \times n / 9550 \times f/50$$

or

$$P = M \times n / 9550 \times f/60$$

If a frequency inverter is used in conjunction with a pulse generator, the full 50 Hz or 60 Hz rated torque is available as holding torque at motor standstill (independent fan required for prolonged periods at standstill). In many instances, however, a mechanical brake is necessary for holding a position exactly or for safety reasons.

The use of thermistors for the thermal protection of the motor winding for frequency inverter duty are strictly recommended (available at extra cost for all motor sizes).

### Increased torque with reduced duty factor

A reduction in duty factor increases the torque available at the low end of the frequency range (up to the transition frequency for field weakening) in accordance with the factors in the table below:

Duty factor	Motor torque with reduced duty factor	Increase in current requirement approximate
100 %	-	-
60 %	1.15 x S1 torque	1.15 x S1 current
40 %	1.30 x S1 torque	1.30 x S1 current
25 %	1.45 x S1 torque	1.45 x S1 current
15 %	1.60 x S1 torque	1.60 x S1 current

This, in turn, means that short-term overload by a factor of 1.6 is permissible for starting from a low speed, for example. An increase in torque in the field-weakening range due to a reduction in duty factor is possible only under certain conditions; the 1.6x S1 torque generally cannot be achieved

### Increased torque with external fan

If an independent fan is used, the S1-torque in the lower frequency range (below 30 Hz) need not be reduced, i.e., when it has an independent fan the motor can provide the 50 Hz or 60 Hz rated torque throughout the entire frequency range to the cut-off frequency of the field weakening.

With a high quality frequency inverter of 160 %, when independent ventilation is combined with a reduced duty factor the 50 Hz or 60 Hz torque is available from rest through to the transition frequency of the field weakening range.

External ventilation is available for motor types D..08.. and larger (see chapter 16 "Motor-independent fan (FV). In many instances, a more economical alternative is to select a larger motor without external ventilation.

# Motors

## Operation with frequency converter

---

### Energy-saving function

High quality frequency inverters reduce voltage in part-load operation to lower the motor current and thus improve efficiency. This converter function emulates the method of operation of commercially available "energy-saving devices".

### Regeneration

Regenerative torques (braking torques) are required for motors used in lifting gear, for example. In conjunction with high quality frequency inverters, the motor torques listed in the table can also be applied as regenerative torques. As with motor torque, an increase in regenerative torque with reduced duty factor is permissible.

### Notes on operation with other-make frequency inverters

The precondition is that the motor current generated by the frequency converter is largely free of harmonics. The harmonics generated in the motor by some old-style frequency inverters result in additional losses and cut available torque by some 10 % across the entire frequency range. There is also a risk of oscillation causing damage to the gear unit.

At frequencies below approximately 5 Hz, operation without pulse generators is possible only using a frequency inverter with state-of-the-art control. If frequency inverters are used that do not feature load-dependent frequency and current adjustment, the increase in the motor's current consumption means that, particularly in the case of small motors (D..04..-D..09..), torque has to be reduced at frequencies below approximately 10 Hz even if an external fan is used or the duty factor is reduced. Regenerative operation is possible only under certain circumstances.

Winding configuration for standard motors for 400 V / 50 Hz.

All motors are suitable for the voltage range 380...420 V or 400 V +/- 10 % if executed in insulation class F.

**Important:** Current, power factor and torque change as voltage deviates from 400 V.

See "www.bauergears.com" for more information.

$P_N$	Rated power
$n_N$	Guideline value for rated speed at the rotor shaft
$M_N$	Rated torque at the rotor shaft
$I_N$	Rated current (the current can be converted in inverse ratio to the voltages for the desired special voltage)
$\cos\phi$	Power factor
$I_A/I_N$	Relative starting current
$M_A/M_N$	Relative starting torque
$M_S/M_N$	Relative pull-up torque
$M_K/M_N$	Relative breakdown torque
$J_{rot}$	Mass moment of inertia of the rotor

The standard motor winding configuration is for 400 V / 50 Hz.

See "www.bauergears.com" for more information.

Winding configuration for standard motors for 460 V / 60 Hz.

All motors are suitable for the voltage range 440...480 V or 460 V +/- 10 % if executed in insulation class F.

**Important:** Current, power factor and torque change as voltage deviates from 460 V.

See "www.bauergears.com" for more information.

$P_N$	Rated power
ED	Duty cycle
$n_N$	Guideline value for rated speed at the rotor shaft
$M_N$	Rated torque at the rotor shaft
$I_N$	Rated current (the current can be converted in inverse ratio to the voltages for the desired special voltage)
$\cos\phi$	Power factor
$I_A/I_N$	Relative starting current
$M_A/M_N$	Relative starting torque
$M_S/M_N$	Relative pull-up torque
$M_K/M_N$	Relative breakdown torque
$J_{rot}$	Mass moment of inertia of the rotor

The standard motor winding configuration is for 460 V / 60 Hz.

See "www.bauergears.com" for additional information.

P<sub>N</sub> Rated power

M Permissible load torque (S1-100 %) at the rotor shaft by operation with a frequency inverter

I Load current for operation with frequency inverter

Field weakening for frequencies above 50 Hz, winding for standard voltage **400 V Y / 50 Hz**, Temperature Class F.ation with frequency inverter

Motors with standard windings can be switched from Y- to Δ- circuit for operation with a converter having a single-phase mains connection. This has no effect on the torques and frequencies as listed in the table above. As regards the choice of converter, however, note that currents are higher than those of the Y-circuit by a factor of 1.73.

The load currents in the table are guideline values for selecting the size of frequency inverter. Load current is lower if the load torque is below the values permitted for 30-70 Hz and the frequency inverter used is of the high-grade type. This means that a smaller inverter can sometimes be used, particularly in conjunction with large motors.

Operation with frequency converter, 50 Hz

50 Hz

P<sub>N</sub> Rated power

M Permissible load torque (S1-100 %) at the rotor shaft by operation with a frequency inverter

I Load current for operation with frequency inverter

Field weakening for frequencies above 50 Hz, winding for standard voltage **400 V Y / 50 Hz**, Temperature Class F.

Motors with standard windings can be switched from Y- to Δ- circuit for operation with a converter having a single-phase mains connection. This has no effect on the torques and frequencies as listed in the table above. As regards the choice of converter, however, note that currents are higher than those of the Y-circuit by a factor of 1.73.

The load currents in the table are guideline values for selecting the size of frequency converter. Load current is lower if the load torque is below the values permitted for 30-70 Hz and the frequency inverter used is of the high-grade type. This means that a smaller inverter can sometimes be used, particularly in conjunction with large motors.

$P_N$  Rated power

M Permissible load torque (S1-100 %) at the rotor shaft by operation with a frequency inverter

I Load current for operation with frequency inverter

Field weakening for frequencies above 50 Hz, winding for standard voltage **400 V Y / 50 Hz**, Temperature Class F.

Motors with standard windings can be switched from Y- to  $\Delta$ - circuit for operation with a converter having a single-phase mains connection. This has no effect on the torques and frequencies as listed in the table above. As regards the choice of converter, however, note that currents are higher than those of the Y-circuit by a factor of 1.73.

The load currents in the table are guideline values for selecting the size of frequency converter. Load current is lower if the load torque is below the values permitted for 30-70 Hz and the frequency inverter used is of the high-grade type. This means that a smaller inverter can sometimes be used, particularly in conjunction with large motors.

$P_N$  Rated power

M Permissible load torque (S1-100 %) at the rotor shaft by operation with a frequency inverter

I Load current for operation with frequency inverter

Field weakening for frequencies above 87 Hz, winding for  
**230 V  $\Delta$  / 50 Hz ( $U_{max} = 400 V \Delta$  / 87 Hz)**, Temperature Class F.

The load currents in the table are guideline values for selecting the size of frequency inverter. Load current is lower if the load torque is below the values permitted for 30-100 Hz and the frequency inverter used is of the high-grade type. This means that a smaller inverter can sometimes be used, particularly in conjunction with large motors.

Operation with frequency converter, 60 Hz

**60 Hz**

- P<sub>N</sub> Rated power
- M Permissible load torque (S1-100 %) at the rotor shaft by operation with a frequency inverter
- I Load current for operation with frequency inverter

Field weakening for frequencies above 60 Hz, winding for standard voltage **460 V Y / 60 Hz**, Temperature Class F.

Motors with standard windings can be switched from Y- to Δ- circuit for operation with a converter having a single-phase mains connection. This has no effect on the torques and frequencies as listed in the table above. As regards the choice of converter, however, note that currents are higher than those of the Y-circuit by a factor of 1.73.

The load currents in the table are guideline values for selecting the size of frequency converter. Load current is lower if the load torque is below the values permitted for 36-84 Hz and the frequency inverter used is of the high-grade type. This means that a smaller inverter can sometimes be used, particularly in conjunction with large motors.

$P_N$  Rated power

M Permissible load torque (S1-100 %) at the rotor shaft by operation with a frequency inverter

I Load current for operation with frequency inverter

Field weakening for frequencies above 60 Hz, winding for standard voltage **460 V Y / 60 Hz**, Temperature Class F.

Motors with standard windings can be switched from Y- to  $\Delta$ - circuit for operation with a converter having a single-phase mains connection. This has no effect on the torques and frequencies as listed in the table above. As regards the choice of converter, however, note that currents are higher than those of the Y-circuit by a factor of 1.73.

The load currents in the table are guideline values for selecting the size of frequency converter. Load current is lower if the load torque is below the values permitted for 36-84 Hz and the frequency inverter used is of the high-grade type. This means that a smaller inverter can sometimes be used, particularly in conjunction with large motors.

### Functional description

The compression springs act on the anchor disc, which is free to move in the axial direction and presses the brake disc, which is keyed to the rotor shaft, against the friction plate or the motor bearing plate. This produces the braking torque.

When a DC voltage is applied to the coil in the electromagnet housing, it generates a magnetic force that opposes the spring force and causes the anchor disc to be pulled toward the electromagnet enclosure.

This releases the brake disc and disengages the brake.

Brakes are classified into two types according to how they are used: holding brakes and working brakes.

### Holding brake ES.. / ZS..

brake that in normal operation does not convert kinetic energy into frictional energy but is only used to hold a mechanism in a particular position, but which can also be used for motion braking in an emergency.

### Service brake ESX.. / ZSX..

A brake that converts kinetic energy into frictional energy in normal operation, which means that it brakes mechanical motion.

When a working brake is used as a holding brake, the braking torque tolerance of up to -30 % (in new condition) must be taken into account.

### Product description of type ES(X) spring-actuated brakes

Figure 1: Construction of ES(X) brake

### Construction of ES(X) brake

1	Electromagnet housing	9	Hollow screw
2	Brake disc	10	Retaining ring
3	Compression spring	11	Key
4.1	Cover plate with closed brake	12	Retaining ring
4.2	Shaft seal with through shaft	13	Screw plug for checking air gap
5	Drive bush	14	Friction plate (only with motor size Dxx08 or Dxx09)
6	Anchor disc	15	Screw plug for checking microswitch setting
7	O-ring	16	Microswitch (optional)
8	Fitting screw with copper washer	17	Manual release (optional)

### Brake mounting

ES and ESX: Brake mounting is under the fan cover  
EH and EHx: Brake mounting is on the fan cover

### Options

- Manual release, non-locking or locking
- Microswitch for monitoring operation or wear

# Motor Mounted Components

## Brake

### Product description of type ZS(X) spring-actuated brakes

Figure 2: Construction of ZS(X) brake

### Construction of ZS(X) brake

1	Electromagnet housing	9	Hollow screw
2.1	Brake disc	10	Retaining ring
2.2	Brake disc	11	Key
3	Compression spring	12	Retaining ring
4.1	Cover plate	13	Cover
4.2	Shaft seal with through shaft	14	Fitting screws
5	Drive bush	15	Bracket
6	Anchor disc	16	Assembly screw/assembly aid
7	O-ring	17	Microswitch (optional)
8	Fitting screw with copper washer	18	Manual release (optional)

### Options

- Manual release, non-locking or locking
- Microswitch for monitoring operation or wear

### Brake selection and sizing

If the working brake is undersized, it will have increased wear and a shorter lifetime. If it is oversized, the resulting mechanical forces may overload the drive.

If specific application data is not available, in the case of horizontally driven equipment we recommend selecting a braking torque with a safety factor (K) of 1 to 1.5 times the rated torque of the motor.

For braking to standstill, the selected braking torque should be at least 80 % of the rated torque of the drive.

Rated torque:

$$M_{\text{Berf}} = \frac{P \times 9550}{n_2} \times K$$

$M_{\text{Berf}}$	Braking torque	[Nm]
P	Motor power	[kW]
n	Rated speed at rotor shaft	[rpm]

For lifting operation, a braking torque equal to twice the rated motor torque should always be chosen for safety reasons.

If the moment of inertia, speed and allowable deceleration time of the machine are known, the braking torque can be calculated as described below.

### External moments of inertia

**If the masses to be decelerated by the brake do not run at the same speed as the rotor shaft, the moment of inertia ( $J_{\text{ext}}$ ) must be reduced to the value at the rotor shaft**

$$J_{\text{ext}'} = \frac{J_{\text{ext}1} \times n_1^2 + J_{\text{ext}2} \times n_2^2 + \dots + J_{\text{ext}n} \times n_n^2}{i^2}$$

or the external moment of inertia reduced by the gear ratio of the gear unit to the value at the rotor shaft.

$$J_{\text{ext}'} = \frac{J_{\text{ext}}}{i^2}$$

$J_{\text{ext}}$	Total external moment of inertia [kgm <sup>2</sup> ]
$J_{\text{ext}'}$	Total external moment of inertia referenced to the rotor shaft [kgm <sup>2</sup> ]
$J_{\text{ext}1,2,\dots}$	Individual external moments of inertia [kgm <sup>2</sup> ]
i	Gear reduction ratio
n	Rotor shaft speed
$n_{1,2,\dots}$	Speeds of the individual moments of inertia [rpm]

Load torque under static load

$$M_L = F \times r$$

$M_L$	Load torque [Nm]
F	Force [N]
r	radius [m]

### Braking torque with dynamic load

A purely dynamic load is present when flywheels, rolls, etc. must be decelerated and the static load torque is negligible.

$$M_a = \frac{J_{ges} \times n_a}{9,55 \times (t_a - t_A)} = \frac{(J_{ext} + J_{rot} + J_{Br}) \times n_a}{9,55 \times (t_a - t_A)}$$

$J_{br}$	Moment of inertia of the brake [kgm <sup>2</sup> ]
$J_{rot}$	Moment of inertia of the rotor shaft and rotor [kgm <sup>2</sup> ]
$M_a$	Deceleration torque [Nm]
$n_a$	Initial speed at start of deceleration [rpm]
$t_a$	Total deceleration time (from switch-off until drive is stationary) [s]
$t_A$	The response time of the brake for braking corresponds to $t_{AC}$ or $t_{DC}$ in the specification tables [s]

### Dynamic and static loads

In most application situations, both static and dynamic loads are present.

$$M_{Berf} = (M_a \pm M_L) \times K \quad \text{where} \quad M_{Berf} \leq M_{Br} \quad \text{must hold true.}$$

$M_L$  braking (positive) or driving (negative) load torque [Nm]

### Heat generated by each brake cycle

Friction converts the kinetic energy of the moving masses into heat.

This amounts to

$$W = \frac{J_{ges} \times n_a^2}{182,5} = \frac{(J_{ext} + J_{rot} + J_{Br}) \times n_a^2}{182,5} \quad \text{where} \quad W \leq W_{max} \quad \text{must hold true.}$$

$W$	Braking energy for each brake cycle [J]
$M_{max}$	Maximum permissible frictional energy per brake cycle (see brake tables)

### Thermally allowable braking energy of working brakes

With a uniform sequence of brake cycles, which means a certain average number of brake cycles per hour, the temperature rises until an equilibrium between heat input and heat dissipation is reached. The temperature rise must be sized to avoid overheating the coil and the friction layer, taking the ambient temperature into account.

#### Braking to standstill:

$$W_z = W \times Z \leq W_{th}$$

$W_{th}$  Maximum allowable braking energy per hour

$W_z$  Braking energy with Z brake cycles

Z Number of brake cycles per hour

#### Lifting operation

In lowering operation, the drive motor acts as a generator and its braking effect results in a steady downward motion (constant speed). If we ignore transmission losses, under full load the drive must brake the load with the rated motor torque. If a mechanical brake with a braking torque equal to the braking torque of the motor is applied after the drive is switched off, the downward motion will continue at the same speed. This means that additional braking torque is necessary to stop the motion of the load. For example, if the brake is dimensioned for 200 % braking torque, approximately 100 % is used for "static" deceleration and the rest is used for "dynamic" deceleration.

If part of the braking torque is required for braking the load during lowering (downward motion), the brake engagement time is greater, and the thermal load is therefore greater.

In this case

$$W_H = \frac{M_{Br}}{M_{Br} - M_L} \times W_z$$

$W_H$  Friction energy per hour in lifting operation

$M_{Br}$  Braking torque of the brake

#### Brake lifetime

The energy absorbed during braking causes the brake disc to wear, which increases the air gap. If the air gap increases beyond a certain maximum gap size, the magnetic field is so weak that the pulling force of the electromagnet is no longer sufficient to release the brake. A proper air gap must be restored by adjusting the air gap or by replacing the brake disc, depending on the type of brake construction.

The maximum number of brake cycles until service is necessary can be calculated as follows:

$$Z_L = \frac{W_L}{W}$$

$Z_L$  Number of brake cycles until the air gap limit is reached

$W_L$  Maximum allowable braking energy until maintenance; i.e. replacing the brake disc or adjusting the air gap. Adjustment of the air gap is possible only with type ZXSxx brakes.

#### Deceleration time

The pure braking time from the start of mechanical braking to standstill depends on the braking deceleration.

Especially with lifting operation, but also in other types of operation, it is necessary to check whether the load torque reinforces the braking effect or counters the braking effect.

The deceleration time is therefore calculated as follows:

$$t_a = \frac{J_{ges} \times n_a}{9,55 \times (M_{Br} \pm M_L)}$$

### Electrical connection

### General

There are two basic options for providing the supply voltage for the DC electromagnet:

1. Externally from an existing DC control voltage mains or a rectifier in the cabinet.
2. From a rectifier built into the motor or brake terminal box. In this case, the rectifier can be powered either directly from the motor terminal board or from the mains.

Note that in the following cases the rectifier is not allowed to be connected to the terminal board of the motor:

- Pole-changing motors and motors with wide operating voltage range
- Operation from a frequency converter
- Other configurations in which the motor voltage is not constant, such as operation with soft-start devices, start-up transformers, etc.

### Release

When the rated voltage is applied to the electromagnet coil, the current through the coils increases exponentially and with it the generated magnetic field. The current must rise to a certain value ( $I_{\text{release}}$ ) before it overcomes the spring force and starts to release the brake.

Figure 3: Idealised curves of coil voltage, coil current and motor speed with normal excitation (N) and overexcitation (Ü).  
 $t_U$ : overexcitation time;  $t_{AN}$ ,  $t_{AU}$ : Response time with normal excitation and overexcitation.

Two different situations can arise during the response time  $t_A$ , assuming that the voltage is applied to the motor and the brake simultaneously:

- The motor is locked if  $M_A < M_L + M_{Br}$   
The motor draws its locked-rotor current, which increases the thermal load on the motor.  
This situation is illustrated in Figure 3.
- The brake slips if  $M_A > M_L + M_{Br}$   
In this case, the brake is also thermally stressed during start-up and wears faster.

$M_A$ : locked rotor torque of the motor;  $M_L$ : load torque;  $M_{Br}$ : braking torque

As can be seen, there is an additional load on the motor and brake in both cases. The effect of the response time increases with increasing brake size. Consequently, it is advisable to reduce the response time, especially with medium-sized and large brakes and with a high cycle rate. This can be achieved relatively easily by means of electrical overexcitation. With this approach, the coil is briefly operated at twice its rated voltage after switch-on.

This causes the current to rise faster than with normal excitation, and it reduces the response time by approximately 50 %. This overexcitation function is built into the type MSG special rectifier.

The release current increases with increasing air gap, and with it the response time. When the release current exceeds the rated coil current, the brake will not be released with normal excitation and the brake has reached its wear limit.

### Braking

The brake does not start generating braking torque immediately after the coil voltage is switched off. First the magnetic energy must decline to the point that the spring force can overcome the magnetic force. This occurs at the holding current  $I_{hold}$ , which is lower than the release current.

The response time depends on how the voltage is switched off.

Switching off the AC supply voltage to a type SG standard rectifier

- a) Rectifier powered from the motor terminal board (Figure 4, curve 1)  
Response time  $t_{A1}$ : very long

Cause: Due to the residual magnetism of the motor, after the motor voltage is switched off a slowly decaying voltage is induced, and it continues to supply power to the rectifier and thereby to the brake. In addition, the magnetic energy of the brake coil is dissipated relatively slowly in the freewheel circuit of the rectifier.

- b) Rectifier powered separately (Figure 4, curve 2)  
Response time  $t_{A2}$ : long

Cause: After the rectifier voltage is switched off, the magnetic energy of the brake coil is dissipated relatively slowly in the freewheel circuit of the rectifier.

If the supply voltage is interrupted on the AC side, no significant switch-off voltage occurs on the electromagnet coil.

### Interrupting the DC circuit of the electromagnet coil (Figure 4, curve 3)

- a) By a mechanical switch  
 - with separate power supply from a DC control voltage mains or  
 - at the DC switch contacts (A2 and A3) of the type SG standard rectifier  
 Response time  $t_{A3}$ : very short

Cause: The magnetic energy of the brake coil is dissipated very quickly by arcing across the switch contacts.

- b) Electronic

Using a type ESG or MSG special rectifier

Response time  $t_{A3}$ : short

Cause: The magnetic energy of the brake coil is dissipated quickly by a varistor integrated in the rectifier.

Figure 4: Idealised coil current and motor speed curves after switching off power on the AC side (1 and 2) or DC side (3)

If the circuit is interrupted on the DC side, a high voltage  $u_q$  is induced by the electromagnet coil. The magnitude of this voltage depends on the inductance  $L$  of the coil and the switch-off speed  $di/dt$  according to the formula

$$u_q = L \cdot \frac{di}{dt}$$

Due to the winding design, the inductance  $L$  increases with increasing rated coil voltage. Consequently, the voltage spikes induced at switch-off can reach hazardous levels with relatively high coil voltages. For this reason, a varistor is included in the circuit for all brakes with voltages greater than 24 V.

This varistor is solely intended to protect the electromagnet coil; it is not intended to protect adjacent electronic components or devices against electromagnetic interference. On request, brakes with rated voltages of 24 V or less can also be fitted with a varistor.

If the circuit is interrupted on the DC side by a mechanical switch, the resulting arcing over the switch contacts causes strong erosion of the contacts. For this reason, only special DC contactors or adapted AC contactors with contacts rated for use class AC3 as specified in EN 60947-4-1 may be used.

### Specifications of holding brakes with emergency stop capability

The maximum allowable friction energy values stated here do not apply to brake motors for use in areas with potentially explosive atmospheres.

Refer to separate data in appropriate documents for explosion-proof drives.

\* Requires overexcitation; permissible only with MSG rectifier

\*\* Cannot be combined with PMSM motors of the S series

Braking torque tolerance: -10 / +30 %

W<sub>th</sub> and W<sub>L</sub> are not specified because little or no braking energy is dissipated by holding brakes when they are used as intended.

For versions with braking torque marked with \*, which may only be used with an MSG rectifier, the values of t<sub>A</sub> and t<sub>DC</sub> apply to operation with an MSG rectifier; i.e. t<sub>A</sub> for overexcitation or t<sub>DC</sub> for electronic circuit interruption on the DC side.

Due to the effects of operating temperature and manufacturing tolerances, actual response times may differ from the guideline values listed here.

\* Requires overexcitation; permissible only with MSG rectifier

\*\* Cannot be combined with PMSM motors of the S series

\*\*\* HL = manual release

Braking torque tolerance:

E003 / E004: -10 / +30 %

ESXxx / ZSXxx: -20 / +30 % after run-in; up to -30 % in new condition.

For versions with braking torque marked with \*, which may only be used with an MSG rectifier, the values of t<sub>A</sub> and t<sub>DC</sub> apply for operation with an MSG rectifier; i.e. t<sub>A</sub> for overexcitation or t<sub>DC</sub> for electronic circuit interruption on the DC side.

The values for W<sub>L</sub> are guidelines; actual values may vary significantly depending on the application situation. Periodic inspection of the air gap or brake disc thickness is recommended.

Actual response times may differ from the times listed here due to the effects of operating temperature, brake disc wear and manufacturing tolerances.

### Key to symbols

$M_{Br}$	Rated braking torque
$W_{max}$	Maximum allowable friction energy for an emergency stop with a holding brake
$W_{max}$	Maximum allowable friction energy for each brake cycle with working brakes
$W_{th}$	Maximum allowable braking energy per hour
$W_L$	Maximum allowable braking energy until maintenance; i.e. brake disc replacement or air gap adjustment. Air gap adjustment is possible only with type ZSxxx brakes.
HL	Manual release
$t_A$	Response time for release with normal excitation. Overexcitation with a type MSG special rectifier reduces the response time by approximately 50 %.
$t_{AC}$	Response time for brakes with AC-side switch-off, i.e. by switching off the supply voltage to a separately powered standard rectifier. If the supply voltage for the rectifier is taken from the motor terminals, considerably longer response times should be expected (depending on the motor size and winding design).
$t_{DC}$	Response time for braking with DC-side circuit interruption by a mechanical switch. In the case of electronic circuit interruption on the DC side by a type ESG or MSG special rectifier, the response times will be approximately two to three times as long.
$P_{el}$	Electromagnet coil power consumption at 20 °C. Depending on the rated voltage of the coil, the actual power may differ from the guideline value stated here.
J	Moment of inertia of the drive bush and brake disc(s)

# Motor Mounted Components

## Brake

### Connection

The electrical connections to the brake are made in the motor terminal box using terminals or the rectifier. Standard voltages:

380–420 V 50/60 Hz (brake coil voltage 180 V DC)

220–230 V 50/60 Hz (brake coil voltage 105 V DC)

24 V DC (brake coil voltage 24 V DC)

Other voltages are available at additional cost.

### DC connection via terminals (K)

The brake must be connected via separate terminals in the motor or brake terminal box directly to the DC voltage. The standard voltages are 180 V DC, 105 V DC and 24 V DC. Brakes with other operating voltages are available at additional cost.

### Standard rectifier (S)

Working principle	Half-wave rectifier with switch contacts for DC-side circuit interruption
Input voltage $U_1$	max. 575 VAC +5 %
Output voltage	$0.45 \times U_1$ VDC
Max. output current	2.5 A DC
Ambient temperature	-40 to +40 °C
Connection	Caged Clamp terminals with clamp lever
Clampable conductor cross-section	max. 1.5 mm <sup>2</sup> without wire end sleeve max. 1.5 mm <sup>2</sup> with wire end sleeve
Approvals	c-CSA-us c-UL-us (only in combination with B2000 geared motors and brakes in the ES(X) or ZS(X) product series)

The brake must be connected to the AC supply via the standard rectifier in the motor terminal box or brake terminal box. The standard voltages are 380 ... 420 V 50/60 Hz or 220 ... 230 V 50/60 Hz. Other voltages up to 575 V are available at extra cost. In a configuration with standard rectifier, the brake circuit can be interrupted by an extra contact on the d.c. side in order to reduce the response time. This significantly reduces the braking time and overtravel distance.

Voltage connection for the rectifier from the motor terminal block or cage clamp (see Rectifier Connection on Motor Terminal Block or Cage Clamp)

# Motor Mounted Components

## Brake

### Rectifier for electronic rapid shutdown (E)

Working principle	Half-wave rectifier with electronic DC-side circuit interruption
Input voltage $U_1$	220–460 V AC $\pm 5\%$ , 50/60 Hz
Output voltage	$0.45 \times U_1$ V DC
Max. output current	1 A DC
Ambient temperature	-20 °C to +40 °C
Clampable conductor cross-section	max. 1.5 mm <sup>2</sup>

This rectifier permits electronic DC-side interruption of the brake circuit. No additional cable to the rectifier is necessary. The rectifier is supplied complete with a protective resistor which prevents a mains short-circuit via the shutdown arc of the high-speed motor contactor. Brake response times are significantly shorter than those achievable by AC-side interruption of the brake circuit. They are, however, longer than those achievable with DC-side interruption by a mechanical switch. The brake must be connected to the alternating current via the rapid shutdown rectifier in the motor terminal box or the brake terminal box. The standard voltages are 380 ... 420 V 50/60 Hz or 220 ... 230 V 50/60 Hz. Other voltages up to 460 V are available at extra cost.

Voltage connection for the rectifier from the motor terminal block or cage clamp (see Rectifier Connection on Motor Terminal Block or Cage Clamp)

### Standard rectifier (M)

Working principle	MSG 1.5.480I Half-wave rectifier with time-limited overexcitation and electronic DC-side circuit interruption Fast shutdown due to no motor current in one phase
Input voltage $U_1$	220–480 V AC +6 / -10 %, 50/60 Hz
Output voltage	0.9 x $U_1$ V DC during overexcitation 0.45 x $U_1$ V DC over overexcitation period
Overexcitation time	0.3 s
Max. output current	1.5 A DC
Ambient temperature	-20 °C to +40 °C
Clampable conductor cross-section	max. 1.5 mm <sup>2</sup>
Working principle	MSG 1.5.500U Half-wave rectifier with time-limited overexcitation and electronic DC-side circuit interruption Fast shutdown due to the absence of input voltage
Input voltage $U_1$	220–500 V AC ±10 %, 50/60 Hz
Output voltage	0.9 x $U_1$ V DC during overexcitation 0.45 x $U_1$ V DC over overexcitation period
Overexcitation time	0.3 s
Max. output current	1.5 A DC
Ambient temperature	-20 °C to +40 °C
Clampable conductor cross-section	max. 1.5 mm <sup>2</sup>

In cases where there are high motor switching frequencies, the brake can be de-energised more rapidly with this rectifier thereby significantly reducing the thermal stress on the motor. In addition, interrupting the brake's DC circuit by electronic means significantly reduces response times. Depending on the circumstances in which they are to be used, either the MSG 1.5.500 U (rapid shutdown brought about by removed supply voltage) or MSG 1.5.480 I (rapid shutdown brought about by removed motor current in a phase) is used. Power supply 220 to 480 V AC.

# Motor Mounted Components

## Brake

Rectifier Connection on Motor Terminal Block or Cage Clamp

---

<b>Brake connection, operation with frequency converter</b>	The voltage present at the motor terminal block when operating with a frequency converter is frequency-dependent. Brakes require a constant voltage, so they need a separate electrical connection. This is the reason why the brake is not connected to the motor terminals ex-works.
<b>Brake connection, pole-changing motors</b>	The brakes of pole-changing motors need a separate electrical connection. As is the case with motors for operation with frequency inverters, the brake is not connected to the motor terminals ex-works.
<b>Manual release (HA, HN)</b>	All brakes are available with mechanical manual release on request. Non-latching manual release is the standard version (HN). A latching manual release (HA) can be supplied if required for all brake sizes.
<b>Explosion protection</b>	Brakes for use in hazardous areas are subject to special regulations. Please consult our support specialists in these special cases.
<b>Back stop (RR, RL)</b>	<p>Motors of size D..08 to D..22 are available with backstop. The locking rotational direction clockwise (RR) or anticlockwise (RL) is to given in the order. The reference is the connection side of the gearbox. Should the connection side not be clearly defined, gearbox side "V" (front) will be assumed (see chapter 17 Dimensions drawing "Motor with back stop").</p> <p>Note that the back-stop functionality on a motor operating with a frequency converter is guaranteed only at rotor speeds above 740/min.</p> <p>It is advisable to consult BAUER for applications in corrosive atmospheres, especially for motor-down installed positions.</p>

# Motor Mounted Components

## Brake

**Second motor shaft extension (ZW, ZV)** The motors are also available on request with a second motor shaft extension in design ZW (shaft with key) or ZV (shaft with square end).

Half the central motor's rated power is available at each of the two shafts. Permissible radial loads available on request. Guards are not included in the scope of supply (for dimensional drawing see chapter 16).

Motors with brakes are available on request with a second shaft stub extended through the brake.

**Protective fan cowl (D)** A protective hood over the fan cowl is recommended for outdoor installations where the motor is pointing upward and subject to severe or prolonged exposure to water (dimensional drawing, see chapter 16).

This protective hood is mandatory for upright explosion-proof motors.

A special fan cowl for the textiles industry is available on request at extra cost. This design prevents airborne fibres and fluff clogging the fan cowl.

**Motor-independent fan (FV)** For special applications, standard motors and brake motors of size D08 and larger are available with externally mounted motor-independent fans. The standard line voltage of the motor-independent fan matches the voltage of the geared motor (dimensional drawing for motor-independent fan, see chapter 16).

The independent fans are supplied as standard with Bayonet-fitting for standard motors sizes D..16 and D..18 and brake motors sizes D..11 to D..18.

### Shaft encoder (G)

Bauer gear motors can be fitted with either an incremental encoder or an absolute encoder for special applications. Both the standard incremental encoder and the absolute encoder are optimised and suitable for use with all modern inverters.

Bauer standard encoders as from motor frame size D05 (0,18 kW) are protected against mechanical damage by means of a protective cover (Additional Dimension Sheet see chapter 16).

Special features: standard incremental encoder:

- Robust mount
- EMC-tested
- Protected against polarity reversal
- Supply voltage 8-30 V DC
- A-, B- and N-lines and inverted signals or output signals as preferred
- HTL output circuit (TTL on request)
- 1024 pulses per revolution

Special features: standard absolute encoder

- Steps per revolution: 8192 (13 Bit)
- Number of turns: 4096 (12 Bit) shaft turns
- Execution of electronic: SSI (Synchronous-Serial Interface)
- Output code: Gray-Code
- Supply voltage: 11-27 V DC
- Loss efficiency (no load):  $\leq 3$  Watt
- Output driver: RS-422 (2-wire)

# Motor Mounted Components

## Incremental rotary encoder

### Functional description

Incremental encoders are used to determine motor shaft positions. An incremental encoder detects rotary motion and converts it into an electrical output signal. An encoder disc with a specific number of periods per rotation senses angular motion. The optoelectronic scanning unit generates signals and issues pulses after the signals have been processed in trigger stages. The resolution is defined by the number of opaque and clear segments on the encoder disc. For example, an encoder with 1024 lines will generate a sequence of 1024 pulses for one full rotation.

The combination of an incremental encoder and a frequency converter allows optimised solutions to be developed, such as

- speed controllers with a wide adjustment range
- accurate speed control
- constant-speed control
- position control

Supply voltage:	8–30 V DC with HTL 5 V DC with differential TTL
Output signals:	HTL A, B and N tracks; optional TTL
Pulses per revolution:	1024 Optional 1...65536

<sup>1</sup> Shield connected to plug housing.

Insulate unused outputs before putting into service.

### Functional description

Absolute encoders detect both angular and rotational motions and convert them into electrical signals. In contrast to incremental encoders, with absolute encoders the current position is directly available. If an absolute encoder is moved mechanically while it is switched off, after the power is switched on again the current position can be read out immediately and directly. Absolute encoders are available in single-turn and multi-turn versions.

### Profibus DP interface

### Specifications

Supply voltage	11–27 VDC
No-load current consumption	< 350 mA
Total resolution <sup>1</sup>	≤ 33 bits
Number of steps per revolution, standard/extended <sup>1</sup>	≤ 8,192 / ≤ 32,768
Number of turns, standard/extended <sup>1</sup>	≤ 4,096 / ≤ 256,000
Profibus DP V0	IEC 61158, IEC 61784
PNO encoder profile	Class 1/Class 2
parameters <sup>1</sup>	Counting direction switchover, scaling function, etc.
Output code <sup>1</sup>	Binary, Gray, truncated Gray
Address	3–99, set using a rotary switch
Baud rate	9.6 kbit/s to 12 Mbit/s
TR-specific functions <sup>1</sup>	Gear and speed outputs
Data width on bus for actual position	≤ 25 bits
Permissible mechanical speed	≤ 12,000 rpm
Shaft load	Own mass
Bearing life	≥ 3.9 × 10 <sup>10</sup> revolutions at
- speed	≤ 6,000 rpm
- operating temperature	≤ 60 °C
Shaft diameter [mm]	10H7
Permissible angular acceleration	≤ 10 <sup>4</sup> rad/s <sup>2</sup>
Moment of inertia	2.5 × 10 <sup>-6</sup> kg m <sup>2</sup> (typical)
Start-up torque at 20 °C	2 Ncm (typical)
Weight	0.3–0.5 kg

<sup>1</sup>) Configurable parameter

### Ambient conditions

Vibration (EN 60068-2-6:1996)	≤ 100 m/s <sup>2</sup> , sinusoidal 50–2,000 Hz
Shock (EN 60068-2-27:1995)	≤ 1000 m/s <sup>2</sup> , half-cycle sinusoidal 11 ms
EMC	- Interference emission compliant with EN 61000-6-3:2007 - Interference immunity compliant with EN 61000-6-2:2006
Operating temperature	0 °C to +60 °C; optionally -20 °C to +70 °C
Storage temperature	-30 °C to +80 °C, dry
Relative humidity (EN 60068-3-4:2002)	98 %, non condensing
Enclosure rating (EN 60529:1991) <sup>2</sup>	IP65

<sup>2</sup> With mating connector fitted and/or cable glands fitted and tightened

Enclosure rating (EN 60529:1991) <sup>2)</sup>	IP65

<sup>2)</sup> With mating connector fitted and/or cable glands fitted and tightened

In addition to the angular position within a rotation, multiturn encoders detect multiple rotations. An internal reduction gear mechanism connected to the motor shaft is used to detect the number of turns. Consequently, the value measured by a multiturn encoder consists of the current angular position and the number of turns. As with incremental encoders, the reading is calculated and output via various interface modules, depending on the interface.

On request, a large range of motor frames can be fitted with sensor bearings. The output signal from the sensor allows the direction of rotation to be determined, among other things. The number of possible pulse counts depends on the frame size. Please enquire for more information.
