BAUER GEAR MOTOR™

A REGAL REXNORD BRAND

Bauer Gear Motor

Electric motors account for around 50 per cent of the European Union's industrial energy demands. This corresponded to CO₂ emissions of around 578 million tonnes in 2020. By expanding the use of efficient motors under the regulation, an additional 40 million tonnes of CO₂ will be saved annually, reducing the annual energy bill of EU households and industry by around EUR 20 billion by 2030.

Bauer Gear Motor welcomes the EU Directive

EU Directive 2009/125/EC (Ecodesign requirements for energy-related products) defines the conditions for these savings. The EU member states have given their support to the new rules for reducing the energy demands of industrial motors. Regulation (EU) 2019/1781 sets ecodesign requirements for electric motors and variable speed drives pursuant to Directive 2009/125/EC.

The ordinance sets out two stages:

From 1 July 2021, motors must comply as a minimum with MEPS (Minimum Efficiency Performance Standards) energy efficiency class IE2 (High Efficiency) in the power range ≥ 0.12 to $< 0.75\text{kW}$ and IE3 (Premium Efficiency) for motors with rated power of $\geq 0.75\text{ kW}$. From 1 July 2023, single-phase motors and Ex eb motors with increased safety must comply as a minimum with energy efficiency class IE2 (High Efficiency) for motors with rated power of $\geq 0.12\text{ kW}$.

Company policy

We are also seeing our efforts in the field of ecodesign paying off. As Bauer Gear Motor pursues its objectives, it is also seeking to minimise

both its consumption of raw materials and energy and its impact on the environment, while using resources efficiently. Bauer Gear Motor fully supports the Directive, especially as most of our developments take energy saving on board.

What does the EU directive mean?

IEC 60034-30-1 is a global standard for energy-saving motors. The IEC 60034-30-1 standard is gradually being incorporated into national legislation worldwide as a basis for setting the minimum requirements for energy efficiency levels of electric motors. Electric motors account for approximately 1,470 TWh of the EU's total energy demands in 2020. Using energy-efficient motors would save around EUR 20 billion, reducing total cost of ownership (TCO) and global warming. Bauer Gear Motor PMSM drives already comply with the requirements of IE4 and IE5, as set out in the new technical specifications of IEC TS 60034-30-2.

New IE (International Energy Efficiency) efficiency classes

were introduced at the beginning of 2009:

IE1 = Standard Efficiency

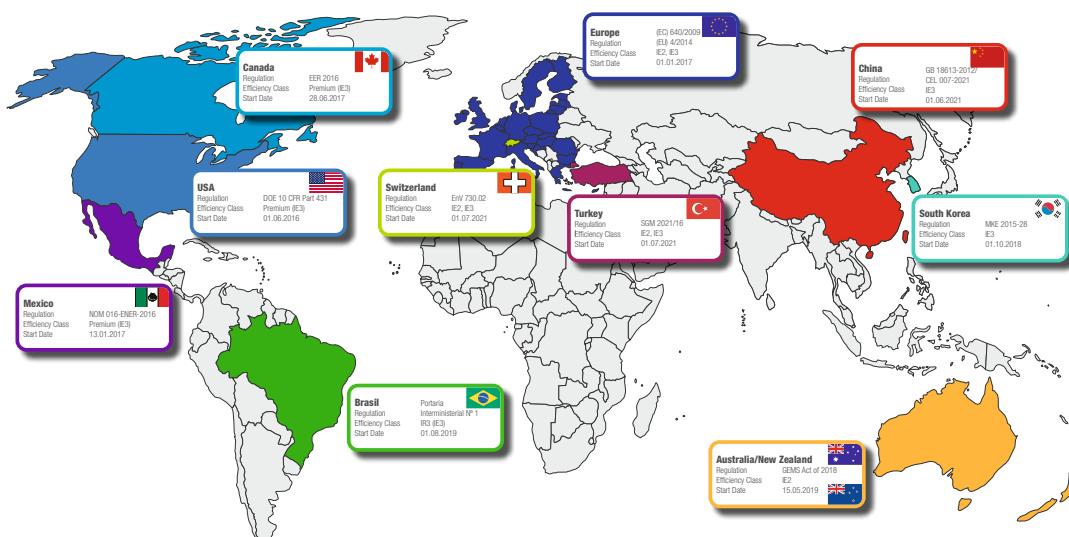

IE2 = High Efficiency

IE3 = Premium Efficiency

IE4 = Super Premium Efficiency

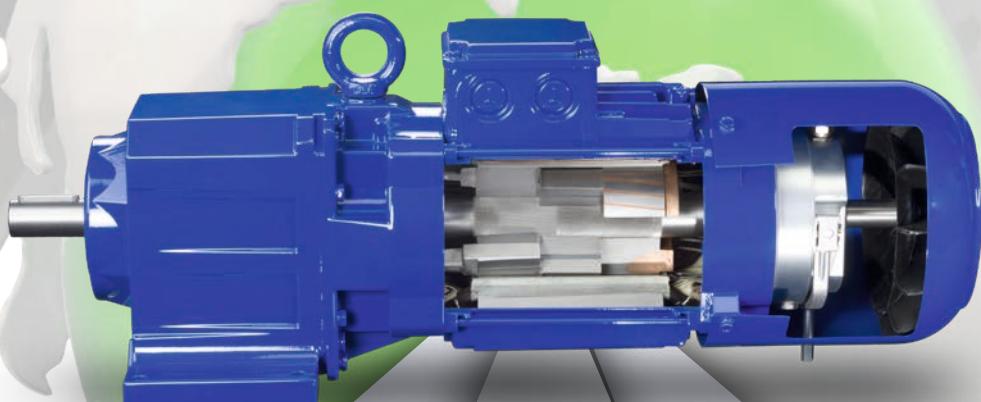

IE5

Worldwide Energy Efficiency Requirements

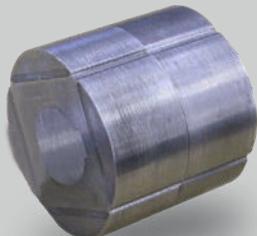

Comparison of the Motor Technologies

ALUMINIUM

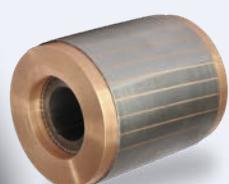

Reference Losses 100%

PERMANENT MAGNET

No voltage induction in the rotor

- No heat losses in the rotor
- Rotor losses reduced by 100%
- Total losses reduced by approximately 25%
- Total efficiency increased by more than 10%
- Partial load efficiency increased by more than 30%
- Synchronous speed
- High starting torque

COPPER

Higher electrical conductivity of copper

- Rotor resistance reduces by 40%
- Heat losses in rotor reduced by 40%
- Total losses reduced by 10...15%
- Total efficiency increased by 1...2%

Investment security for the future

The Bauer Gear Motor range of motors offers trend-setting technologies for energy-efficient drives and for motor designs tailored to specific applications. The latter option enables highly efficient drive solutions without requiring additional space.

| η | Advantages | Your benefits |
|---------|---|---|
| Without | <ul style="list-style-type: none"> • Motor design according to duty • Small installation volume and minimum weight • Higher motor powers | <ul style="list-style-type: none"> • Economical • Small installation space • Efficient motor utilisation • Smaller motor frame size • Tailored to customer application |
| IE1 | <ul style="list-style-type: none"> • Standard efficiency in continuous operation • Small installation volume and minimum weight | <ul style="list-style-type: none"> • Economical • Small installation space • Can be used universally in other EU countries |
| IE2 | <ul style="list-style-type: none"> • Higher efficiency in continuous operation • Higher start-up torque | <ul style="list-style-type: none"> • Economical • Small installation space • Up to 34% more energy savings compared to IE1 • Lower rated motor power than IE1 for dynamic load applications • Short amortisation period |
| IE3 | <ul style="list-style-type: none"> • Premium efficiency in continuous operation • Higher start-up torque | <ul style="list-style-type: none"> • Up to 18% more energy savings compared to IE2 • Already meets the minimum efficiency requirement of 2021/2023 today |
| IE4 | <ul style="list-style-type: none"> • Super premium efficiency for variable speed operation • Speed control with very high efficiency • Small installation volume and minimum weight • Considerably better efficiency than IE3 motors, even under partial load conditions • High torque and power density • High overload capacity | <ul style="list-style-type: none"> • Up to 28% more energy savings compared to IE3 • Short amortisation period • Small installation space • Compact drive unit • More torque with same size motor frame • Requires smaller installation space with same power • Reduced number of variants thanks to higher efficiency over the entire torque range • Design security thanks to spare drive unit capacity • Technology leader • Already meets the efficiency requirements of future standards |
| IE5 | <ul style="list-style-type: none"> • Speed control with highest possible efficiency • Small installation volume and minimal weight • Significantly better efficiency than IE3 motors, even in the partial load range • High torque and power density • High overload capacity | <ul style="list-style-type: none"> • Up to 59% more energy savings compared to IE3 • Short amortisation period • Small installation space • Compact drive unit • More torque with same size motor frame • Requires smaller installation space with same power • Reduced number of variants thanks to higher efficiency over the entire torque range • Design security thanks to spare drive unit capacity • Technology leader • Already meets the efficiency requirements of future standards |

Short ROI (Return on Invest) times

Three different rotor technologies, which can be configured according to the required efficiency classes, ensure highly efficient drive solutions without requiring additional space. Bauer energy saving gear motors fully exploit the energy saving potential of the drive technology in modular and in application-specific standards. Using efficient gear variants optimises the saving potential as a gear motor unit still further and considerably speeds up the ROI.

HIDDEN COSTS

CONTROL THE VISIBLE COSTS

When considering total investment costs, the pure purchasing price of components is only a fraction of the total costs. We speak here about the budgeted costs which are, amongst others, administrative costs, transport and delivery, goods incoming, customs and even up to and including costs for returns.

REDUCE THE HIDDEN COSTS

The majority are the so called „hidden costs“. These follow-up costs are influenced strongly dependent on the drive technology used. The sum of costing factors such as energy efficiency, servicing, stocking, maintenance, cleaning, downtime and spare parts, named here only as an example of the total costs, show the large variety of „hidden costs“.

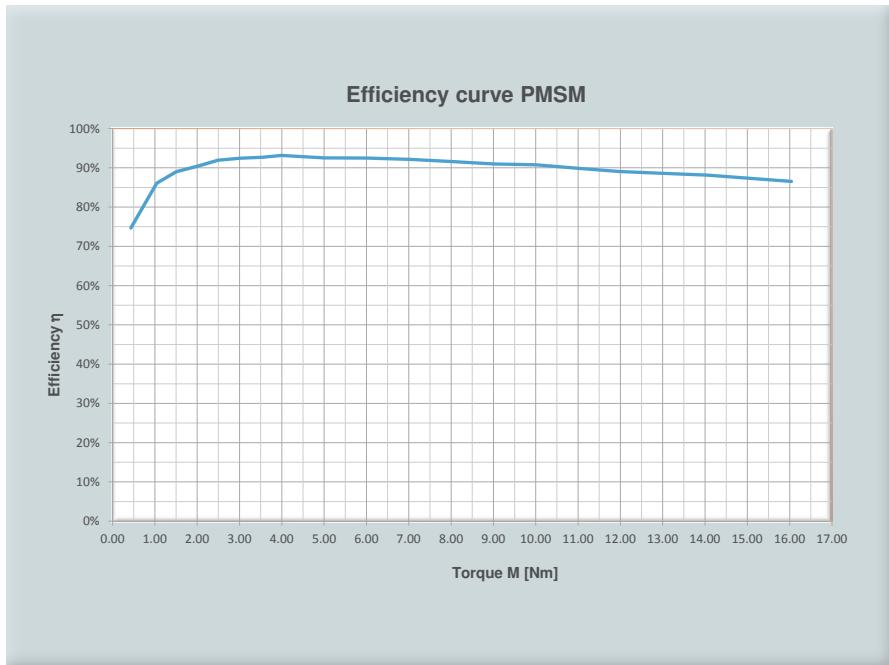

BauerTCO

Advanced TCO assessment

Improvement of the working capital by . . .

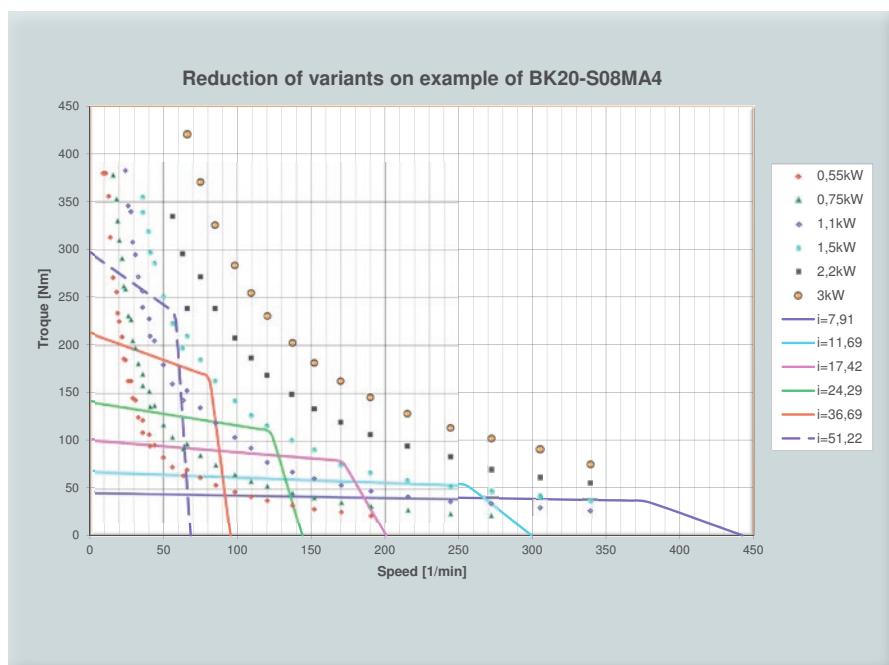

Correctly exploiting the energy savings potential opens up methods and resources for taking full advantage of the cost and variant optimisation opportunities that exist within the framework of the TCO assessment.

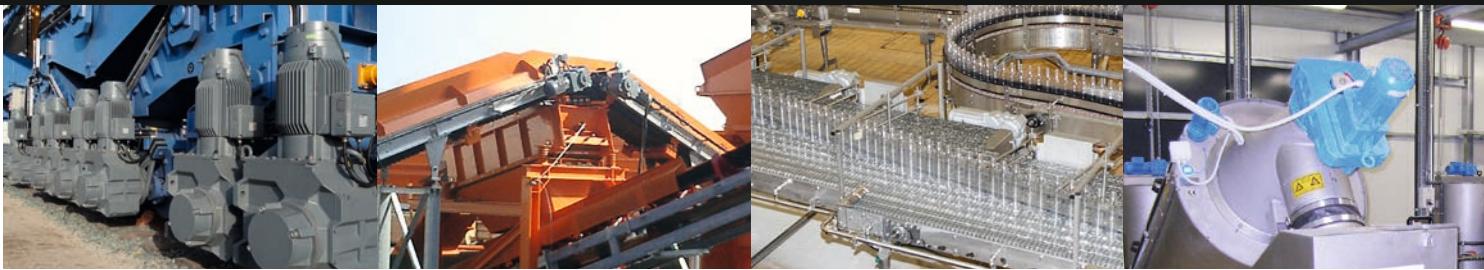

The highly efficient motor technologies have the considerable advantage that they demonstrate a constant level of efficiency with the correct control under very wide-ranging partial load conditions. In particular, a permanent magnet synchronous motor under partial load conditions with a load factor of up to 1:5 demonstrates a constant, and using current technology, highest level of efficiency of IE5 according to IEC TS 60034-30-2.

This offers for gear motors with the highest energy savings, the possibility of significantly reducing the variety of different asynchronous motors in the field.

. . . reduction of variants

The development of energy saving motors helps therefore not only to lower CO₂ emissions but also offers users the benefit of drastically reducing the complexity of the variants used as well as costs in relation to storage, logistics, servicing and repairs.

Permanent Magnet Synchronous Motors PMSM

The stator of a permanent magnet synchronous motor has the same structure as the stator of a three-phase asynchronous induction motor (ASM), with three separate phase windings. However, a PMSM has a rotor with embedded permanent magnets made from the rare-earth material, instead of the squirrel-cage rotor found in induction motors.

These permanent magnets and the resulting constant magnetic field eliminate the need for inducing a magnetic field in the rotor in order to produce torque, and they eliminate the need for a speed difference (slip) between the rotating fields of the stator and the rotor, which is required in an induction motor. The rotor rotates synchronously with the rotating field of the stator.

A synchronous motor cannot start up by itself when connected to the mains, due to the inertia of the rotor and the high speed of the rotating stator field. Magnetic coupling between the two components is not possible under these conditions. Consequently, the rotor must be

brought up to the speed of the rotating field. A frequency converter allows this to be done by increasing the speed of the rotating field in a controlled manner while maintaining magnetic coupling between the stator and the rotor.

Synchronous motors run at constant speed independent of the load. The torque of a synchronous motor is proportional to the current. The input current necessary for the required torque is determined from the rotor position and the motor data on the following page. This requires a field-oriented frequency converter with a suitable algorithm for controlling synchronous motors.

PM synchronous motors have considerably higher power density and much better efficiency than induction motors. For geared motors, this yields higher system efficiency with minimal installation volume. PMSM drives can produce higher torques with the same installation volume, which may allow a smaller motor size to be used in some applications.

Your benefit:

- Small installation volume and minimal weight
- Extremely high efficiency under rated operating conditions
- Considerably better efficiency than induction motors, even under partial load conditions
- High torque density and power density
- High overload capacity
- Lower life-cycle costs
- Clear operating cost saving potential (resulting in a smaller CO₂ footprint)
- Short payback time
- Futureproof Investment

Reverse EMF constant k_e :

The reverse EMF is the voltage induced in the rotor by the magnetic field of the stator. It depends on the rotational speed of the rotor.

Torque constant k_t :

Ratio of motor torque to motor current in amperes [A].

D-axis inductance L_d :

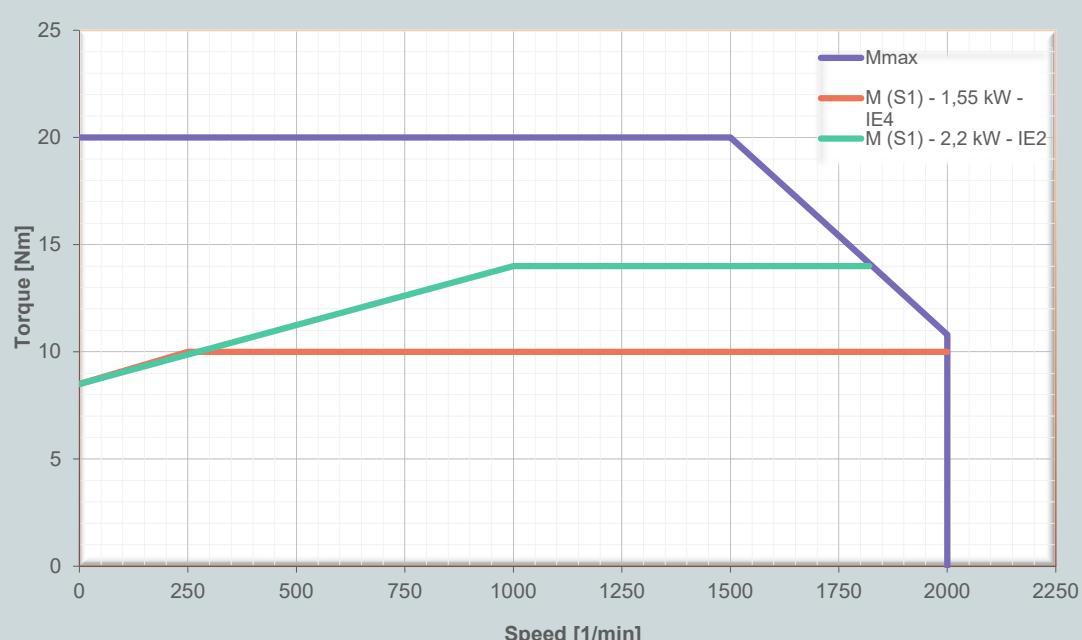

The inductance in the direction of current component i_d , which generates the magnetic flux.

Q-axis inductance L_q :

The inductance in the direction of current component i_q , which generates the torque.

Inductance

A measure of the ability of an electrical conductor to produce a magnetic field.
